## DATA HANDBOOK SYSTEM

To provide you with a comprehensive source of information on electronic components, subassemblies and materials, our. Data Handbook System is made up of three series of handbooks, each comprising several parts.

The three series, identified by the colours noted, are:

# ELECTRON TUBES (9 parts) BLUE <br> SEMICONDUCTORS AND INTEGRATED CIRCUITS (6 parts) RED 

COMPONENTS AND MATERIALS (7 parts)
Green

The several parts contain all pertinent data available at the time of publication, and each is revised and reissued periodically; the contents of each series are summarized on the following pages.
We have made every effort to ensure that each series is as accurate, comprehensive and up-to-date as possible, and we hope you will find it to be a valuable source of reference.
Where ratings or specifications quoted differ from those published in the preceding edition they will be pointed out by arrows.

You will understand that we can not guarantee that all products listed in any one edition of the handbook will remain available, or that their specifications will not be changed, before the next edition is published.
If you need confirmation that the published data about any of our products are the latest available, may we ask that you contact our representative. He is at your service and will be glad to answer your inquiries.

## ELECTRON TUBES (BLUE SERIES)

This series consists of the following parts, issued on the dates indicated.
Part 1 Transmitting tubes (Tetrodes, Pentodes); January 1972
Amplifier circuit assemblies
Part 2 Tubes for microwave equipment ..... February 1972
Part 3 Special Quality tubes;
Miscellaneous devicesMarch 1972
Part 4 Receiving tubes ..... June 1972
Part 5 Cathode-ray tubes; Photo tubes; Camera fubes ..... July 1972
Part 6 Devices for nuclear equipment June 1971
Photomultiplier tubes
Channel electron multipliers
Scintillators
Photoscintillators

Radiation counter tubes

Semicinductor radiation detectors

Neutron generator tubes

Photo diodes
Part 7 Gas-filled fubesVoltage stabilizing and reference tubesCounter, selector, and indicator tubesTrigger tubesSwitching diodes

Part 8 T.V.Picture tubes
August 1971

## Part 9 Transmitting tubes (Triodes) ; Tubes for r.f. heating (Triodes)

December 1971

July 1971
Thyratrons Ignitrons
Industrial rectifying tubes
High-voltage rectifying tubes

## SEMICONDUCTORS AND INTEGRATED CIRCUITS (RED SERIES)

This series consists of the following parts, issued on the dates indicated.

Part 1 Diodes; Thyristors; Stacks<br>Signal diodes<br>Variable capacitance diodes<br>Voltage regulator diodes

September 1971

Rectifier diodes
Thyristors, diacs, triacs
Rectifier stacks

Part 2 Low frequency and Deflection transistors

Part 3 High frequency and Switching transistors
November 1971

## Part 4 Special types

Transmitting transistors
Microwave devices
Field effect transistors
Dual transistors
Microminiature devices for thick- and thin-film circuits

December 1971
Photoconductive devices
Photodiodes
Phototransistors
Light emitting diodes
Infra-red sensitive devices

Part 6 Digital Integrated Circuits
DTL (FC family)
DTL/HNIL (FZ family)
TTL (FJ family)

February 1972

March 1972
TTL (GJ family)
CML (GH family)
MOS (FD family)

## COMPONENTS AND MATERIALS (GREEN SERIES)

This series consists of the following parts, issued on the dates indicated.

## Part 1 Circuit Blocks, Input/Output Devices, <br> Electro-mechanical Components, Peripheral Devices

October 1971

Circuit blocks 40 -Series
Counter modules 50-Series Norbits 60-Series, 61-Series
Circuit blocks 90-Series

## Part 2 Resistors, Capacitors

Fixed resistors
Variable resistors
Non-linear resistors
Ceramic capacitors

Input/output devices
Electro-mechanical components
Peripheral devices

December 1971
Paper capacitors and film capacitors
Electrolytic capacitors
Variable capacitors

Part 3 Radio, Audio, Television
FM tuners
Coil assemblies
Piezoelectric ceramic resonators and filters
Loudspeakers

February 1972
Audio and mains transformers
Television tuners, aerial input assemblies
Components for black and white television Components for colour television Deflection assemblies for camera tubes

Part 4 Magnetic Materials, Piezoelectric Ceramics, Ni Cd cells
May 1972

Ferrites for radio, audio and television
Small coils and assembling parts
Ferroxcube potcores and square cores

Ferroxcube transformer cores
Piezoelectric ceramics
Permanent magnet materials
Cylindrical nickel cadmium cells
Part 5 Memory Products, Magnetic Heads, Quartz Crystals,

August 1972 Microwave Devices, Variable Transformers

Ferrite memory cores Matrix planes, matrix stacks Complete memories Magnetic heads

Part 6 Electric Motors and Accessories, Timing and Confrol Devices
Stepper motors
Small synchronous motors
Asynchronous motors

Part 7 Circuif Blocks
Circuit blocks 100 kHz Series
Circuit blocks 1 -Series
Circuit blocks 10 -Series

Quartz crystal units, crystal filters
Isolators, circulators
Variable mains transformers

August 1971

Small d.c. motors
Tachogenerators and servomotors Indicators for built-in test equipment

## September 1971

Circuit blocks for ferrite core memory drive

## CATHODE-RAY TUBES

General and screen types

## LIST OF SYMBOLS

Symbols denoting electrodes and electrode connections
Heater or filament
Cathode
k
Grid g
Grids are distinguished by means of an additional numeral; the electrode nearest to the cathode having the lowest number.

Deflection plates intended for deflection in horizontal direction.

Deflection plates intended for deflection in vertical direction.
Sectioned deflection plates are indicated by an additional decimal e.g. $\mathrm{y}_{1.1} \mathrm{y}_{1.2}$ and $\mathrm{y}_{2} .1 \mathrm{y}_{2} .2$

External conductive coating m
Fluorescent screen $\ell$
Tube pin which must not be connected externally i.c.
Tube pin which may be connected externally n.c.

## Symbols denoting voltages

Symbol for voltage, followed by an index denoting
the relevant electrode.
Heater or filament voltage $\mathrm{V}_{\mathrm{f}}$
Peak value of a voltage
Peak to peak value of a voltage

## Symbols denoting currents

$$
\begin{array}{ll}
\text { Remark I } & \begin{array}{l}
\text { The positive electrical current is di- } \\
\text { rected opposite to the direction of the } \\
\text { electron current. }
\end{array} \\
\text { Remark II } & \begin{array}{l}
\text { The symbols quoted represent the av- } \\
\text { erage values of the concerning cur- } \\
\text { rents unless otherwise stated. }
\end{array}
\end{array}
$$

Symbol for current followed by an index denoting the relevant electrode.

Heater or filament current
Symbols denoting powers
Dissipation of the fluorescent screen
Grid dissipation

## Symbols denoting capacitances

See I.E.C. Publication 100.
Symbols denoting resistances
Symbol for resistance followed by an index for the relevant electrode pair. When only one index is given the second electrode is the cathode.
When $R$ is replaced by $Z$ the "resistance should read "impedance"

## Symbols denoting various quantities

Brightness ..... B
Frequency ..... f
Magnetic field strength ..... H
Deflection coefficient ..... M

## GENERAL OPERATIONAL RECOMMENDATIONS CATHODE-RAY TUBES

## GENERAL

Unless otherwise stated the data are given for a nominal tube.

## LIMITING VALUES

Unless otherwise stated the tubes are rated according to the absolute maximum rating system.

## HEATER

## Parallel operation

The heater voltage must be within $\pm 7 \%$ of the nominal value when the supply voltage is at its nominal value, and when a tube having the published heater characteristics is employed.
This figure is permissible only if the voltage variation is dependent upon more than one factor. In these circumstances the total tolerance may be taken as the square root of the sum of the squares of the individual deviations arising from the effect of the tolerances of the separate factors, providing no one of these deviations exceeds $\pm 5 \%$. Should the voltage variation depend on one factor only, the voltage variation must not exceed $\pm 5 \%$.

## Series operation

The heater current must be within $\pm 5 \%$ of the nominal value when the supply voltage is at its nominal value and a tube having the published heater characteristics is employed. This figure is permissible only if the current variation is dependent upon more than one factor. In these circumstances the total tolerance may be taken as the square root of the sum of the squares of the individual deviations arising from the effects of the tolerances of the separate factors, providing no one of these deviations exceeds $\pm 3.5 \%$. Should the total current variation depend upon one factor only, the current variation must not exceed $\pm 3.5 \%$. When calculating the tolerances of associated components, the ratio of the change of heater voltage to the change of heater current in a typical series chain including a cathode ray tube is taken as 1.8 , both deviations being expressed as percentages.

## HEATER (continued)

With certain combinations of valves and tube, differences in the thermal inertia may result in particular heaters being run at exceedingly high temperature dur ing the warming up period. During this period unless otherwise stated in the published data, it is permissible for the heater voltage of the tube to rise to a maximum value of $50 \%$ in excess of the nominal rated value when using a tube with the published heater characteristics. A surge limiting device may be necessary in order to meet this requirement. When measuring the surge value of heater voltage, it is important to employ a peak reading device, such as an oscilloscope.
In addition to the quoted above, fluctuations in the mains supply voltage not exceeding $\pm 10 \%$ are permissible. These conditions are, however, the worst which are acceptable and it is better practise to maintain the heater as close to its published ratings as possible. Furthermore in all types of equipment closer adjustment of heater voltage or current will react favourably upon tube life and performance.

## CATHODE

The potential difference between cathode and heater should be as low as possible and in any case must not exceed the limiting value given on the data sheets for individual tubes. Operation with the heater positive with respect to cathode is not recommended. In order to avoid excessive hum the A.C. component of the heater-to-cathode voltage should be as low as possible e.g. less than $20 \mathrm{~V}_{\mathrm{rms}}$. When the heater is in a series chain or earthed, the $50 \mathrm{c} / \mathrm{s}$ impedance between heater and cathode should not exceed $100 \mathrm{k} \Omega$. If the heater is supplied from separate transformer windings the resistance between heater and cathode must not exceed $1 \mathrm{M} \Omega$.

## ELECTRODES

In no circumstances should the tube be operated without a D.C. connection between each electrode and the cathode. The total effective impedance between any electrode and the cathode should be as low as possible and must never be allowed to exceed the published maximum value.

## ELECTRODE VOLTAGES

Reference point for electrode voltages is the cathode. For cathode drive service the reference point is grid No. 1.

Grid cut-off voltages
Values are given for the limits of grid cut-off voltage per unit of the first accelerator voltage. The brightness control voltage should be arranged so that it can handle any tube within the limits shown, at the appropriate first accelerator voltage.

## First accelerator voltage

The first accelerator electrode of a so called unipotential lens provides by applying a fixed voltage independent focus and brightness controls. Care should be taken not to exceed the maximum and minimum limits for reasons of reliability and performance.

## Deflection blanking electrode voltage

The mean potential of the deflection blanking electrode should be equal to that of the first accelerator.
If applicable the voltage difference ( $\Delta \mathrm{V}_{\mathrm{g}_{3}}$ ) given in the data should be applied to the beam blanking electrode to obtain beam blanking of a stated beam current for all tubes of the relevant type.

## Focusing voltage

The focusing electrode voltage limits are given in the data. The focus voltage supply should be arranged such that it can handle these limits, so that in any tube the cross-sectional area of the electron-beam on the screen can be optimally displayed. As the focus current is very limited a high resistance series chain may be used.

## Astigmatism control electrode voltage

To achieve optimum performance under all conditions it is desirable to apply a voltage for control of astigmatism (a difference in potential of this electrode and the $y$ plates). The required range to cover any tube is given in the relevant data.

## Beam centring electrode voltage

The beam centring electrode facilitates the possibility to centre the scan in $x$ direction with respect to the geometric centre of the faceplate by applying a voltage, the limits of which are given in the relevant data, to this electrode. Optimum condition is obtained when the brightness at both left and right edges of the scan are equal.

## Deflection plate shield voltage

It is essential that the deflection plate shield voltage equals the mean y plates voltage.

Geometry control electrode voltage
By varying the potential of this electrode the necessary range of which is given in the relevant data the possible occurrence of pin-cushion and barrel-pattern distortion can be contralled.

## Deflection voltages

For optimum performance it is essential that true symmetrical voltages are applied. It should further be noted that the mean $x$ and $y$ plate potentials must be equal. Moreover the deflection plate shield voltage, the mean astigmatism control voltage, if applicable the mean beam centring electrode voltage and the geometry electrode voltage should also be equal to the mean $x$ and $y$ plate potentials. If use is made of the full deflection capabilities of the tube, the deflection plates will intercept part of the electron beam near the edge of the scan. Therefore a low impedance deflection plate drive is necessary.

## Raster distortion and its determination

Limits of raster distortion are given for most tubes.
A graticule, consisting of concentric rectangles is aligned with the electrical $x$ axis of the tube. The edges of a raster will fall between these rectangles with optimum correction potentials applied.

Measuring procedure:
a) Shift the $x$-trace to the centre of the graticule.
b) Align horizontal centre line of graticule with the centre line of the $x$-trace.
c) Shift x-trace vertically between resp. upper and lower two horizontal lines of graticule.
The centre of the $x$-trace now will not fall outside the area bounded by the horizontal graticule lines.
d) Without moving the graticule, switch to a vertical trace and shift this trace horizontally (resp. left and right) between the pairs of vertical lines of the graticule, and also now the centre of the y-trace will not fall outside the area bounded by the vertical graticule lines.
e) Focus and astigmatism will be adjusted for optimum performance.
f) Pattern geometry correction will be adjusted for optimum performance in the sense of minimizing simultaneously the deviation of the centre of $x$-respectively y-trace.

## Linearity

The linearity is defined as the sensitivity at a deflection of $75 \%$ of the useful scan with respect to differ from the sensitivity at a deflection of $25 \%$ of the useful scan. These sensitivities will not differ by more than the indicated value.

## Post deflection shield voltage

In order to optimize contrast in mesh tubes a fixed negative voltage with respect to the geometry control electrode voltage should be applied. The range is given in the data.

## Helix resistance

In order to calculate the high tension supply a minimum resistance is given in the data.

## Final accelerator voltage

Tubes with PDA are designed for a given final accelerator voltage to astigmatism control electrode voltage ratio. Operation at higher ratio may result in changes in deflection uniformity and pattern distortion.

## High tension supply

In order to avoid damage of the screen it is important that prior to the high tension a deflection voltage e.g. the time base voltage is applied.

## LINE WIDTH

Shrinking raster method. Conditions as given in the relevant data.
Focus and astigmatism potentials should be adjusted for optimum performance. Optimum performance is that adjustment which will simultaneously minimize the horizontal and vertical trace widths at the centre of the useful scan.
The raster shall be compressed until the line structure first disappears or begins to overlap or show reverse line structure.
The line width is equal to the quotient of the width of the compressed pattern transverse to the line structure divided by the number of lines which are being scanned.
In older types the line width is measured on a circle with the aid of a microscope.

## CAPACITANCES

Unless otherwise stated the values given are nominal values measured on a cold tube on the tube contacts. The contacts and measuring leads or sockets being screened.

## MOUNTING

Unless otherwise stated the mounting position is any. However, the tube should not be supported by the base alone and under no circumstances should the socket. be allowed to support the tube.
To avoid dangerous glass strain care should be taken when installing the tube.

## Shielding

The tubes must be shielded against electrical and magnetic fields.
Special attention should be paid to the mounting of transformers, coils etc.

## SCREEN

To prevent screen burn stationary or slow moving spots together with high screen currents should be avoided.
If measurements are to be made under high ambient light conditions it is advisable to use a contrast improving filter and or a light hood.

## TRACKING ERROR

Tracking is the ability of a multigun tube to superimpose simultaneously information from each gun.
Tracking error is the maximum allowable distance between the displays of any two guns.

## RATING SYSTEMS ( in accordance with I.E.C. publication 134)

## Absolute maximum rating system

Absolute maximum ratings are limiting values of operating and environmental conditions applicable to any electronic device of a specified type as defined by its published data, which should not be exceeded under the worst probable conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device, taking no responsibility for equipment variations, environmental variations, and the effects of changes in operating conditions due to variations in the characteristics of the device under consideration and of all other electronic devices in the equipment.

The equipment manufacturer should design so that, initially and throughout life, no absolute-maximum value for the intended service is exceeded with any device under the worst probable operating conditions with respect to supply voltage variation, equipment component variation, equipment control adjustment, load variations, signal variation, environmental conditions, and variations in characteristics of the device under consideration and of all other electronic devices in the equipment.

## Design-maximum rating system

Design-maximum ratings are limiting values of operating and environmental conditions applicable to a bogey electronic device of a specified type as defined by its published data, and should not be exceeded under the worst probable conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device, taking responsibility for the effects of changes in operating conditions due to variations in the characteristics of the electronic device under consider ation.

The equipment manufacturer should design so that, initially and throughout life, no design-maximum value for the intended service is exceeded with a bogey device under the worst probable operating conditions with respect to supplyvoltage variation, equipment component variation, variation in characteristics of all other devices in the equipment, equipment control adjustment, load variation, signal variation and environmental conditions.

## Design-centre rating system

Design-centre ratings are limiting values of operating and environmental conditions applicable to a bogey electronic device of a specified type as defined by its published data, and should not be exceeded under normal conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device in aver age applications, taking responsibility for normal changes in operating conditions due to rated supply-voltage variation, equipment component variation, equipment control adjustment, load variation, signal variation, environmental conditions, and variations in the characteristics of all electronic devices.

The equipment manufacturer should design so that, initially, no design-centre value for the intended service is exceeded with a bogey electronic device in equipment operating at the stated normal supply-voltage.

## TYPE DESIGNATION

Two type designation systems are currently in use for our C.R. tubes. All future tubes will have numbers in the "new system", earlier tubes will retain numbers in the "old system".

## NEW CODE SYSTEM (PRO-ELECTRON TYPE DESIGNATION CODE)

The type number consists of a single letter followed by two sets of figures, and ends with one or two letters.

The first letter indicates the prime appplication of the tube:
A - Television display tube for domestic application
D - Oscilloscope tube - single trace
E - Oscilloscope tube - multiple trace
F - Radar display tube - direct view
L - Display storage tube
M - T.V. display tube for professional application - direct view
P - Display tube for professional application - projection
Q - Flying spot scanner
The first group of figures indicates the diameter or diagonal of the luminescent screen in cm.

The second group of figures is a two-figure or three-figure serial number indicating a particular design or development.

The second group of letters indicates the properties if the phosphor screen.
The first letter denotes the colour of the fluorescence or phosphorescence in the case of long or very long afterglow screens.

The second letter of this group is a serial letter to denote other specific differences in screen properties.

For the standard television tube phosphors, the letters ' W ' and ' X ' are used without a second letter.

## TYPE DESIGNATION

A - Purple - reddish purple - bluish purple
B - Blue - purplish blue - greenish blue
D - Blue green
G - Green - bluish green - yellowish green
K - Yellow - green
L - Orange - Orange pink
R - Red - reddish orange - red purple - purplish red - pink - purplish pink
Y - Yellow - greenish yellow - yellowish orange
W - White screen for T.V. display tubes
X - Three-colour screen for T.V. display tubes

## OLD SYSTEM

The type number consists of two letters followed by two sets of figures. The first letter indicates the method of focusing and deflection:

A - Electrostatic focusing and electromagnetic deflection
D - Electrostatic focusing and electrostatic deflection
M - Electromagnetic focusing and electromagnetic deflection
The second letter indicates the properties of the phosphor screen.
See also section "Screen Phosphors"
The first group of figures:
for round tubes: screen diameter in cm
for rectangular tubes: screen diagonal in cm
The second group of figures denotes the serial number.

SCREEN TYPES

| $\begin{gathered} \text { new } \\ \text { system } \end{gathered}$ | old system | fluorescent colour | phosphorescent colour | persistance | equivalent <br> Jedec <br> designation |

## FOCUSING

## DEFLECTION 3) double electrostatic

x plates symmetrical
y plates symmetrical
If use is made of the full deflection capabilities of the tube the deflection plates will intercept part of the electron beam, hence a low impedance deflection plate drive is desirable.

Angle between $x$ and $y$ traces

$$
90 \pm 1^{0}
$$

## LINE WIDTH 3)

Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current $I_{\ell}=10 \mu \mathrm{~A} .1$ )
Line width
1.w.
0.28 mm

1) As the construction of this tube does not permit a direct measurement of the beam current, this current should be determined as follows:
a) under typical operating conditions, apply a small raster display (no overscan), adjust $\mathrm{V}_{\mathrm{g} 1}$ for a beam current of approx. $10 \mu \mathrm{~A}$ and adjust $\mathrm{V}_{\mathrm{g} 3}$ and $\mathrm{V}_{\mathrm{g} 2, \mathrm{~g} 4, \mathrm{~g} 5, \ell}$ for optimum spot quality at the centre of the screen.
b) under these conditions, but no raster, the deflection plate voltages should be changed to
$\mathrm{V}_{\mathrm{y} 1}=\mathrm{V}_{\mathrm{y} 2}=1000 \mathrm{~V} ; \mathrm{V}_{\mathrm{x} 1}=300 \mathrm{~V} ; \mathrm{V}_{\mathrm{x} 2}=700 \mathrm{~V}$, thus directing the total beam current to x 2 .
Measure the current on $\mathrm{x}_{2}$ and adjust $\mathrm{V}_{\mathrm{g} 1}$ for $\mathrm{I}_{\mathrm{X} 2}=10 \mu \mathrm{~A}$ (being the beam current I )
c) set again for the conditions under a), without touching the $\mathrm{V}_{\mathrm{g} 1}$ control. Now a raster display with a true $10 \mu \mathrm{~A}$ screen current is achieved.
d) focus optimally in the centre of the screen (do not adjust the astigmatism control) and measure the line width.
${ }^{3}$ ) See page 4

$\max .125 \mathrm{~V}$
$\max .20 \mathrm{~V}$,
$\max$. $\quad 3 \mathrm{~mW} / \mathrm{cm}^{2}$

1) All that will be necessary when putting the tube into operation is to adjust the astigmatism control voltage once for optimum spot shape in the screen centre. The control voltage will always be in the range stated, provided the mean $x$ plate and certainly the mean y plate potential was made equal to $\mathrm{V}_{\mathrm{g} 2}, \mathrm{~g}_{4}, \mathrm{~g}_{5}, \ell$ with zero astigmatism correction.
2) The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the in dicated value.
${ }^{3}$ ) The mean x and certainly the mean y plate potential should be equal to $\mathrm{V}_{\mathrm{g} 2}, \mathrm{~g}_{4}, \mathrm{~g}_{5}, \ell$ with astigmatism adjustment set to zero.
3) A graticule, consisting, of concentric rectangles of $40 \mathrm{~mm} \times 50 \mathrm{~mm}$ and 39.2 mm x 49 mm is aligned with the electrical x -axis of the tube. The edges of a raster will fall between these rectangles.

## INSTRUMENT CATHODE-RAY TUBE

Oscilloscope tube with 10 cm diameter flat face-plate and post deflection acceleration by means of a helical electrode. The low heater consumption together with the high sensitivity and short overall length render this tube suitable for transistorised equipment.

## Notes

${ }^{1}$ ) This tube is designed for optimum performance when operating at a ratio $\mathrm{V}_{7} / \mathrm{Vg}_{2}, \mathrm{~g}_{4}=6$
The geometry electrode voltage should be adjusted within the indicated range (values with respect to the mean $x$-plate potential). A negative control voltage will cause some pincushion distortion and less background light, a positive control voltage will give some barrel distortion and a slight increase of background light.
2) The deflection plate shield voltage should be equal to the mean $y$-plate potential. The mean $x$ - and $y$-plate potentials should be equal for optimum spot quality.
${ }^{3}$ ) The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessaryadjustment its potential will be within the stated range.
4) The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
5) A graticule, consisting of concentric rectangles of $60 \mathrm{~mm} \times 60 \mathrm{~mm}$ and $58.6 \mathrm{~mm} \times 58.6 \mathrm{~mm}$, is aligned with the electrical x -axis of the tube.
With optimum correction potentials applied the edges of a raster lie between these rectangles.

## INSTRUMENT CATHODE-RAY TUBE

Oscilloscope tube with rectangular 10 cm diagonal flat face and metal-backed screen, provided with internal graticule. The high sensitivities of this mesh tube, together with the sectioned $y$-deflection plates, render the tube suitable for trans istorized oscilloscopes for frequencies up to 100 MHz to 250 MHz .

## NOTES

1) This tube is designed for optimum performance when operating at the ratio $\mathrm{V}_{\mathrm{g}}(\ell) / \mathrm{V}_{\mathrm{g}_{4}}=10$. Operation at other ratios may result in changes in deflection uniformity and geometry distortion. The geometry control electrode voltage should be adjusted for optimum performance. For any necessary adjustment its potential will be within the stated range.
2) This voltage should be equal to the mean y plate potential.
${ }^{3}$ ) The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessary adjustment its potential will be within the stated range.
${ }^{4}$ ) The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan be more than the indicated value.
${ }^{5}$ ) The geometry distortion is such that, with optimum correction potentials applied, it will always be possible to have a scanned raster with the edges remaining between two rectangles, one measuring $80 \mathrm{~mm} \times 50 \mathrm{~mm}$, the other 78.4 mm x 48.5 mm and with:

- coinciding centres
- the longer sides aligned with the electrical $x$-axis of the tube.

## CORRECTION COILS

The D10-200. ./07 is provided with a coil unit consisting of:

1. a pair of coils $L_{1}$ and $L_{2}$ for
a. correction of the orthogonality of the x and y traces enabling the angle between . the x and y traces at the centre of the screen to be made exactly $90^{\circ}$.
b. vertical shift of the scanned area.
2. a single coil $L_{3}$ for image rotation enabling the alignment of the xtrace with the $x$ lines of the graticule.

## Ortogonality and shift (coils $L_{1}$ and and $L_{2}$ )

The current required under typical operating conditions is max. 45 mA for complete correction of orthogonality and shift. This value applies to a tube operating without a mu-metal shield, and will be 30 to $50 \%$ lower with a shield, depending on the shield diameter.
The resistance of each coil is approx. $175 \Omega$.

## Image rotation (coil L3)

The image rotation coil is wound concentrically around the tube neck. Under typical operating conditions a current of max. 30 mA will be required for complete correction. The resistance of this coil is approx. $500 \Omega$.
Connections of the coils
The coils are connected to the 6 soldering tags as follows:

With $\mathrm{L}_{1}$ and $\mathrm{L}_{2}$ connected in series according to Fig. 1, a current in the direction indicated will produce a clockwise rotation of the vertical trace and a anti-clockwise rotation of the horizontal trace.
With the connection according to Fig. 2 the current as indicated will produce an upward shift.

By controlling the current of each coil separately, see Fig. 3, a change in the angle of the traces and a vertical shift can be made simultaneously. The change in angle will be proportional to the algebraic sum of the two currents and the shift to the algebraic difference.

Fig. 3

## INSTRUMENT CATHODE-RAY TUBE

The D13-16../01 is equivalent to the D13-16.. but features an internal graticule. This graticule can be illuminated.

## MECHANICAL DATA

Dimensions in mm

Maximum angle between $x$-trace and,
$x$-axis of the graticule
$\pm 5^{0}$

1) Clear area for light conductor.

## ALIGNMENT

In order to align the x -trace and the x -axis of the graticule an image rotating coil may be used. This coil should be positioned at one third of the cone length, seen from the face end, and can be attached to the inner surface of the mumetal shield.
Under typical operating conditions maximum 50 ampere-turns are required for alignment.

## ILLUMINATION

To illuminate the internal graticule the use of a light conductor (e.g. of Perspex) is obligatory. The following design considerations should be observed: In order to achieve the most efficient light conductance the holes for the light bulb as well as the contact area with the front plate should be polished. The contact with the edges of the front plate should be as close as possible and the edges of the front plate and the corresponding hole in the light conductor should be parallel to achieve light beams perpendicular to the edges. It is advised to apply reflective material to the outer circumference of the conductor and if possible also to both planes (see drawing).

[^0]2) Polished.
${ }^{3}$ ) Close and constant distance to front plate of tube.
It is essential that the light conductor and the front plate of the tube are in plane.
${ }^{4}$ ) If possible reflective material.

beam current of max. $25 \mu \mathrm{~A} \quad \mathrm{I}_{3}=-25$ to $+25 \quad \mu \mathrm{~A}{ }^{7}$ )
$\overline{\left.\left.\left.\left.2)^{3}\right)^{4}\right)^{5}\right)^{6}\right)^{7}}$ See page 6 .

LIMITING VALUES (Absolute max. rating system)

${ }^{1}$ ) To avoid damaging the side contacts the narrower end of the mu-metal shield should have an internal diameter of not less than 70 mm .
${ }^{2}$ ) This tube is designed for optimum performance when operating at the ratio $\mathrm{V}_{\mathrm{g} 9}(\ell) / \mathrm{V}_{\mathrm{g}_{4}}=10$. Operation at other ratio may result in changes in deflection uniformity and geometry distortion. The geometry control electrode voltage should be adjusted for optimum performance. For any necessary adjustment its potential will be within the stated range.
${ }^{3}$ ) This voltage should be equal to the mean $x$ - and $y$ plates potential.
4) The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessary adjustment its potential will be within the stated range.
5) The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
6) A graticule, consisting of concentric rectangles of $100 \mathrm{~mm} \times 60 \mathrm{~mm}$ and $98 \mathrm{~mm} \times 58.2 \mathrm{~mm}$ is aligned with the electrical x axis of the tube. The edges of a raster will fall between these rectangles with optimum correction potentials applied.
7) Values to be taken into account for the calculation of the focus potentiometer.

## CORRECTION COILS

The D13-26.. is provided with a coil unit consisting of a pair of coils for:
a. Correction of the orthogonality of the $x$ and $y$ traces (which means that at the centre of the screen the angle between the x and y traces can be made exactly $90^{\circ}$ ).
b. Vertical shift of the scanned area.

DETAIL DRAWING OF COIL UNIT

Dimensions in mm

1-2 coil no. 1
3-4 coil no. 2

The currents required under typical operating conditions, the tube being screened by a mu-metal shield closely surrounding the coils (e.g. 55555), are max. 7 mA per degree of angle correction and max. 4 mA per mm of shift. If no such shield is used these values have to be multiplied by a factor $k$ $(1<k<2)$, the value of which depends on the diameter of the shield and approaches 2 for the case no shield is present.
The D.C. resistance is approx. $180 \Omega$ per coil.
When designing the supply circuit for these coils it should be considered that the maximum current required in either coil can be 34 mA .

## Circuit diagrams

A suitable circuit permitting independent controls of orthogonality correction and vertical shift is given in fig. 1 .

| $\mathrm{P}_{1}, \mathrm{P}_{4}$ | $:$ Potentiometers $220 \Omega$, | 3 Watt, ganged |
| :--- | :--- | :--- |
| $\mathrm{P}_{2}, \mathrm{P}_{3}$ | $:$ Potentiometers $150 \Omega$, | 2 Watt, ganged |
| $\mathrm{R}_{1}, \mathrm{R}_{2}, \mathrm{R}_{3}, \mathrm{R}_{4}:$ Resistors | $33 \Omega$, | 0,5 Watt |

Fig. 1
The dissipation in the potentiometers can be reduced considerably if the requirement of independent controls is dropped (see fig. 2).

$\mathrm{P}_{1}, \mathrm{P}_{2}$ : Potentiometers, $220 \Omega, 1$ Watt, ganged $P_{3}, P_{4}$ : Potentiometers, $220 \Omega, 1$ Watt, ganged

Fig. 2

A further reduction of the dissipation can be obtained by inserting a commutator for each coil (see fig. 3).
The procedure of adjustment will then become more complicated, but it should be kept in mind that a readjustment is necessary only when the tube has to be replaced.

$\mathrm{P}_{1}, \mathrm{P}_{2}$ : Potentiometers, $500 \Omega, 0,5$ Watt
$\mathrm{S}_{1}, \mathrm{~S}_{2}$ : Commutators
Fig. 3
For the adjustment of the currents the following procedure is recommended:
a. With the tube fully scanned in the vertical direction the scanned area must be shifted so that the useful vertical scan on either side of the geometric centre of the screen meets the published value of 30 mm min.
With the circuit according to fig. 1 this is done by means of the ganged potentiometers $\mathrm{P}_{1}$ and $\mathrm{P}_{4}$.
b. Adjustment of orthogonality by means of the ganged potentiometers $\mathrm{P}_{2}$ and $P_{3}$ in fig.1. A slight readjustment of $P_{1}$ and $P_{4}$ may be necessary afterwards.

With a circuit according to fig. 2 or 3 these corrections have to be performed by means of successive adjustments of the currents in the coils.
The most convenient deflection signal is a square waveform permitting an easy and fairly accurate check of orthogonality.

## INSTRUMENT CATHODE-RAY TUBE

The D13-26../01 is equivalent to the D13-26. . but features an internal graticule. This graticule can be illuminated.

MECHANICAL DATA
Dimensions in mm

Maximum angle between $x$-trace and $x$-axis of the graticule

$$
\pm 5^{0}
$$

1) Clear area for light conductor.

## ALIGNMENT

In order to align the $x$-trace and the $x$-axis of the graticule an image rotating coil may be used. This coil should be positioned at one third of the cone length, seen from the face end, and can be attached to the inner surface of the mu-metal shield. Under typical operating conditions maximum 90 ampere-turns are required for alignment.

## ILLUMINATION OF THE GRATICULE

To illuminate the internal graticule a light conductor (e.g. of perspex) should be used. In order to achieve the most efficient light conductance, the holes for the lamps and the edge adjacent to the tube should be polished, and the distance between the perspex plate and the tube should be as small as possible. It is advisable to apply reflective material to the outer circumference and, if possible, also to the upper and lower faces of the light conductor. The thickness of the conductor should not exceed 3 mm , and its position relative to the frontplate of the tube should be adjusted for optimum illumination of the graticule lines.

1) Reflective material.
2) Polished.
3) Close and constant distance to front plate of tube.

It is essential that the light conductor and the front plate of the tube are in plane.
4 ) If possible reflective material.

## INSTRUMENT CATHODE-RAY TUBE

13 cm diameter flat faced short oscilloscope tube (max. 35 cm ) with post-deflection acceleration by means of a helical electrode. The tube is provided with deflection blanking.

## CORRECTION COILS

The D13-450. ./01 is provided with a coil unit consisting of:

1. a pair of coils for
a. correction of the orthogonality of the $x$ and $y$ traces (which means that the angle between the $x$ and $y$ traces at the centre of the screen can be made exactly $90^{\circ}$ ).
b. vertical shift of the scanned area.
2. a single coil for image rotation (aligning the x trace with the x lines of the graticule).

## Orthogonality and shift

The currents required under typical operating conditions are max. 4 mA per degree of angle correction and max. 2 mA per millimeter of shift; the maximum
$\rightarrow$ current required for both purposes taken together does not exceed 18 mA .
These values apply to a tube operating with a mu metal shield closely surrounding the coils.
If no such shield is used they have to be multiplied by a factor $K(1<K<2)$ the value of which depends on the dimensions of the shield and approaches 2 for the case no shield is present.
The D.C. resistance of each coil is approx. $220 \Omega$.

## Image rotation

The image rotation coil is concentrically wound. Under typical operating conditions a current of max. 45 mA will be required for complete correction. The D.C. resistance of this coil is approx. $550 \Omega$.

## Circuit diagrams

Fig. 1
$\mathrm{P}_{1}, \mathrm{P}_{4}$ potentiometers $220 \Omega, 1$ Watt; ganged
$P_{2}, P_{3}$ potentiometers $220 \Omega, 1$ Watt; ganged

With the above circuit almost independent control for shift and angle correction is achieved. This facilitates the correct adjustment to a great extent.
The dissipation in the potentiometers can be reduced considerably if the requirement of independent controls is dropped (see fig. 2)

Fig. 2
$P_{1}, P_{2}$ potentiometers $220 \Omega, 1$ watt; ganged $P_{3}, P_{4}$ potentiometers $220 \Omega, 1$ watt; ganged

A further reduction of the dissipation can be obtained by providing a commutator for each coil (see circuit fig. 3).
The procedure of adjustment will then become more complicated but it should be kept in mind that a readjustment is necessary only when the tube has to be replaced.

Fig. 3
$\mathrm{P}_{1}, \mathrm{P}_{2}$ potentiometers, $220 \Omega, 1$ Watt
$\mathrm{S}_{1}, \mathrm{~S}_{2}$ commutators
A suitable circuit for the image rotating coil is given in fig. 4 .

Fig. 4
$\mathrm{P}_{5}, \mathrm{P}_{6}$ potentiometers $500 \Omega, 3$ Watt; ganged

The following procedure of adjustment is recommended
a. Align the x trace with the graticule by means of the image rotating coil.
b. With the tube fully scanned in the vertical direction, the image has to be shifted so that the graticule is fully covered. With the circuit according to fig. 1 this is done by means of the ganged potentiometers $\mathrm{P}_{1}$ and $\mathrm{P}_{4}$.
c. Adjustment of orthogonality by means of the ganged potentiometers $\mathrm{P}_{2}$ and $P_{3}$. A slight readjustment of $P_{1}$ and $P_{4}$ may be necessary afterwards.
d. Readjustment of the image rotation if necessary.

With a circuit according to fig. 2 or 3 these corrections have to be performed by means of successive adjustments of the currents in the coils.

The most convenient deflection signal is a square wave form permitting an easy and fairly accurate visual check of orthogonality.

## ILLUMINATION OF THE GRATICULE

To illuminate the internal graticule a light conductor (e.g. of perspex) should be used. In order to achieve the most efficient light conductance, the holes for the lamps and the edge adjacent to the tube should be polished, and the distance between the perspex plate and the tube should be as small as possible. It is advisable to apply reflective material to the outer circumference and, if possible, also to the upper and lower faces of the light conductor. The thickness of the conductor should not exceed 3 mm , and its position relative to the frontplate of the tube should be adjusted for optimum illumination of the graticule lines.
${ }^{1}$ ) Reflective material.
${ }^{2}$ ) Polished.

${ }^{3}$ ) Close and corstant distance to front plate of tube.
It is essential that/the light conductor and the front plate of the tube are in plane.
${ }^{4}$ ) If possible reflective material

## LINE WIDTH 3)

Measured with the shrinking raster method in the centre of the screen under typical operating conditions, adjusted for optimum spot size at a beam current $\mathrm{I}_{l}=10 \mu \mathrm{~A} .1$ )

Line width l.w. 0.30 mm
I) As the construction of this tube does not permit a direct measurement of the beam current, this current should be determined as follows:
a) under typical operating conditions, apply a small raster display (no overscan), adjust $\mathrm{V}_{\mathrm{g} 1}$ for a beam current of approx. $10 \mu \mathrm{~A}$ and adjust $\mathrm{V}_{\mathrm{g} 3}$ and $\mathrm{V}_{\mathrm{g} 2}, \mathrm{~g} 4, \mathrm{~g} 5, \ell$ for optimum spot quality at the centre of the screen.
b) under the se conditions, but no raster, the deflection plate voltages should be changed to
$\mathrm{V}_{\mathrm{y} 1}=\mathrm{V}_{\mathrm{y} 2}=2000 \mathrm{~V} ; \mathrm{V}_{\mathrm{x} 1}=1300 \mathrm{~V} ; \mathrm{V}_{\mathrm{x} 2}=1700 \mathrm{~V}$, thus directing the total beam current to x 2 .
Measure the current on $\mathrm{x}_{2}$ and adjust $\mathrm{V}_{\mathrm{g} 1}$ for $\mathrm{I}_{\mathrm{x} 2}=10 \mu \mathrm{~A}$ (being the beam current Il)
c) set again for the conditions under a), without touching the $\mathrm{V}_{\mathrm{gl}}$ control. Now a raster display with a true $10 \mu \mathrm{~A}$ screen current is achieved.
d) focus optimally in the centre of the screen (do not adjust the astigmatism control) and measure the line width.

## INSTRUMENT CATHODE-RAY TUBE

The D13-500../01 is a wide-band oscilloscope tube designed for observation and measurement of high frequency phenomena.
This tube has a rectangular 13 cm diagonal flat face with aluminized screen and internal graticule, post-deflection accelerator with mesh, vertical deflection by means of a symmetrical helix system, scan magnification in the vertical direction by means of an electrostatic quadrupole lens and correction coils for trace alignment, vertical shift of the display area and correction of the orthogonality of traces.

The scanned raster can be shifted in vertical direction and aligned with the internal graticule by means of correction coils mounted on the tube (see page 14).
For illumination of the internal graticule see page 16 .

## DESCRIPTION

## General

The D13-500. ./01 has been primarily designed for wide-band high-frequency applications. It combines high brightness, high deflection sensitivity and a large bandwidth of the vertical deflection system.
In order to obtain the high "sensitivity, the post-deflection acceleration system embodies a mesh. The sensitivity in the vertical direction has been further increased by means of an electrostatic quadrupole lens that has been inserted between the vertical deflection system and the horizontal deflection plates. The large bandwidth has been obtained by using, for the vertical deflection, a delay-line system instead of deflection plates. With the typical operating conditions, 2500 V first accelerator voltage and 15000 V final accelerator voltage, the vertical and the horizontal deflection factors are about $2 \mathrm{~V} / \mathrm{cm}$ and $15 \mathrm{~V} / \mathrm{cm}$ respectively, with a $10 \times 6 \mathrm{~cm}^{2}$ display area.

The bulb has a rectangular face and the screen is aluminized. To eliminate parallax errors, an internal graticule is incorporated. Correction coils have been provided to permit image rotation, correction of the orthogonality of traces and the adjustment of the vertical useful scan with respect to the graticule.

Fig. 1
Rise time of the display $\boldsymbol{T}$ as a function of the rise time of the input signal $\boldsymbol{\tau}_{2}$

## The vertical deflection system

For the vertical deflection, a delay-line system is used so that transit-time effects are practically eliminated. The system consists of two flattened helices to which a symmetrical deflection signal should be applied. Under these conditions, the characteristic impedance of each helix is $150 \Omega$. The input and output terminals are brought out on opposite sides of the neck on the same plane. The input terminals are connected to the beginning of the helices by means of a matched, internal twowire transmission line. The output of the deflection system should be properly terminated in order to avoid signal reflections.
With the typical operating conditions, the band-width of the deflection system, i.e. the frequency at which the sensitivity is 3 dB below its value at D.C., is about 800 MHz . Even above this frequency, the response decreases only gradually so that, for narrow-band applications, the tube can be used with reduced vertical sensitivity up to about 2000 MHz .

The rise time $\boldsymbol{\tau}_{1}$, i.e. the time interval during which the display of an ideal stepfunction signal applied to the input goes from $10 \%$ to $90 \%$ of its final value, is about 0.45 ns . If the input signal has the rise-time $\boldsymbol{T}_{2}$, the rise-time $\boldsymbol{\tau}$ of the display is approximately given by

$$
\boldsymbol{T}=\sqrt{\tau_{1}^{2}+\tau_{2}^{2}}
$$

In Fig. 1, $\tau$ has been plotted as a function of $\tau_{2}$, with $\tau_{1}=0.45$ ns. If, for example, the tube is used in combination with an amplifier and the rise-time of the display is to be 1.4 ns (corresponding with 250 MHz band-width), the rise-time of the amplifier should be 1.33 ns . It can be seen that in this region the rise-time of the display is almost equal to the amplifier rise-time, without a significant contribution of the cathode-ray tube.
If the tube is to be used without an amplifier in order to make use of its full bandwidth capabilities, care should be taken to ensure good symmetry of the input signal.
Fig. 2 shows how the tube can be connected to a $50 \Omega$ coaxial input. A matched power divider is used which delivers two identical output signals. One of these is inverted by means of a pulse inverter. An additional length of $50 \Omega$ cable should be inserted into the path of the non-inverted signal having the same delay time as the pulse inverter so that the two signals arrive at the input of the deflection system at the same time. The $75 \Omega$ shunt resistors serve to obtain a correct termination of the $50 \Omega$ lines. Since each branch of the power divider has 6 dB attenuation, the sensitivity, measured at the $50 \Omega$ input, is also $2 \mathrm{~V} / \mathrm{cm}$.

Fig. 2
Connection to an asymmetrical $50 \Omega$ input
A: Power divider $\quad \mathrm{R}_{1}, \mathrm{R}_{2}$ : Resistors $75 \Omega$
$B$ : Inverter $\quad \mathrm{R}_{3}, \mathrm{R}_{4}$ : Resistors $150 \Omega$
C: Cable D, D': Deflection system
Note: Delay of inverter B and cable C are equal.

## Scan magnifier and focusing system

As already mentioned, an electrostatic quadrupole lens, i.e. an electron lens which has two mutually perpendicular planes of symmetry, divergent in one plane and convergent in the other, is used for the magnification of the vertical deflection. This lens is inserted between the vertical deflection system and the horizontal deflection plates, with its plane of divergence in the direction of the vertical deflection. Therefore, it magnifies the vertical deflection without affecting the horizontal deflection.

Because of the astigmatic properties of this quadrupole lens, a conventional, rotationally symmetrical focusing lens cannot be used. Instead of this, two more electrostatic quadrupole lenses are incorporated so that focusing is accomplished by means of three quadrupole lenses, with alternating orientation of their planes of convergence and divergence. The focusing action is schematically shown in Fig. 3. The strength of the scan-magnifier lens is controlled by applying to the electrode $g_{9}$ a negative voltage with respect to $g_{2}$. Within a certain range of this voltage, corresponding to a scan-magnification factor Msc, i.e. the ratio of the deviations on the screen with and without scan magnification respectively, between 1.8 and 2 the combined effect of the three lenses will yield an approximately circular spot at moderate beam currents. (At high beam currents, when space-charge repulsion causes an increase of spot size, the width of the vertical lines will be smaller than that of the horizontal lines).

Fig. 3
In this range, line-width at a fixed value of screen current, and screen current at a fixed value of grid No. 1 voltage, are increasing functions of the scan-magnification factor. Figs. 4 and 5 show the average relative change with respect to the values at Msc $=1.9$ which, generally, is the most suitable compromise.

For minimum defocusing of vertical lines near the upper and lower edge of the display area, the electrode $g_{8}$ should be kept at a positive voltage with respect to $g_{2}$ (about 200 V with 2500 V first accelerator voltage). As this voltage also has some effect on the scan-magnification factor, both $g_{8}$ and $g_{9}$ should be connected to $g_{2}$ when the deviation without scan magnification is being measured.

Line-width as a function of the scan-magnification factor (approximately)
Line -width at $\mathrm{M}_{\mathbf{S C}}=1.9$ is $100 \%, \mathrm{I}_{\text {Screen }}=$ const.

Screen current as a function of the scan-magnification factor (approximately) Screen current at $\mathrm{M}_{\mathrm{Sc}}=1.9$ is $100 \%, \mathrm{~V}_{\mathrm{g}_{1}}=$ const.

For the adjustment of the scan-magnification factor the following procedure is recommended:
a. Set $\mathrm{V}_{8}$ and $\mathrm{Vg}_{9}$ to 0 with respect to $g_{2}$.
b. Display a time-base line and adjust $\mathrm{V}_{\mathrm{g}_{6}}$ so that the line appears sharply focused.
c. Apply a square wave signal to the vertical deflection system (the vertical parts of the trace will be out of focus but this is immaterial) and adjust the amplitude so that the height of the display has a convenient value, e.g. 30 mm .
d. Set $\mathrm{V}_{\mathrm{g} 8}$ and $\mathrm{V}_{\mathrm{g} 9}$ to the appropriate values and readjust $\mathrm{V}_{\mathrm{g}_{6}}$ so that the horizontal parts of the trace are again in focus.
e. Check the height of the display (e.g. for $M_{S C}=1.9$ this height should now be 57 mm ).
f . If necessary, readjust $\mathrm{V}_{\mathrm{g}}$, until the desired value of $\mathrm{M}_{\mathrm{Sc}}$ has been obtained.
Focusing is controlled by means of the electrode voltage $\mathrm{V}_{4}$ and $\mathrm{V}_{\mathrm{g}}$. The electrodes $g_{5}$ and $g_{7}$ can be used to centre the beam with respect to the vertical and horizontal deflection systems.

The voltages of the focusing and correction electrodes can be adjusted as follows:
a. Display a square-wave signal on the screen so that both horizontal and vertical traces are visible.
b. Adjust $\mathrm{V}_{\mathrm{g}}^{6}$ so that the horizontal parts of the display are in focus. The vertical parts will, in general, be out of focus.
c. Adjust $\mathrm{V}_{\mathrm{g}}$ so that the vertical traces are brought into focus. Now the horizontal parts of the display will be out of focus again.
d. Repeat b) and c) successively until both vertical and horizontal traces are simultaneously in focus.
e. Adjust $\mathrm{V}_{\mathrm{g}_{3}}$ for minimum width of a horizontal line. If necessary, readjust focusing voltages $\mathrm{V}_{4}$ and $\mathrm{V}_{6}$.
f. Adjust $\mathrm{V}_{\mathrm{g}_{7}}$ for equal brightness at the left-hand and right-hand edges of the display area. If necessary, readjust the focus by means of $\mathrm{V}_{\mathrm{g}_{6}}$.
g . Adjust $\mathrm{V}_{\mathrm{g}_{5}}$ so that the position of a horizontal trace not deflected in the vertical direction is at the centre of the vertical useful scan. If necessary, readjust the focus by means of $\mathrm{V}_{\mathrm{g}_{4}}$.
If the graticule is not fully covered by the scanned area the image should be shifted by adjusting the correction coil current (see page 16) before the adjustment of $\mathrm{V}_{\mathrm{g}_{5}}$ is made.

The procedure for the adjustment of the scan-magnification factor and for focusing, as described above, seams to be rather complicated.
However, in practice it will be sufficient to adjust $\mathrm{V}_{g}$ to its nominal value without determining the scan-magnification factor for each individual tube. As to focusing, the user can, with some experience, achieve the best setting with very few adjustmints.

## Post-deflection acceleration

The use of a p.d.a. shield (mesh) ensures a high deflection sensitivity. A geometry control electrode, $\mathrm{g}_{11}$, serves for the curiection of pin cushion or barrel distortion of the pattern. In order to suppress background illumination due to secondary electrons originating from the p.d.a. shield $\mathrm{g}_{12}$, this shield should be kept 12 V nagative with respect to $g_{11}$ whereas the voltage of the interplate shield, $g_{10}$ should be equal to the mean $x$-plate potential.

Rise time

If use is made of the full deflection capabilities of the tube the deflection plates will intercept part of the electron beam: hence a low impedance deflection plate drive is desirable.

Angle between $x$ and $y$ traces
$90^{\circ} 4$ ) (see page 14 "Correction coils")

1) Because of the applications of a quadrupole lens for the magnification of the vertical deflection, two more. quadrupole lenses are used for focusing. Therefore, controls for two voltages have to be provided.
2) The band-width is defined as the frequency at which the vertical deflection sensitivity is 3 dB lower than at D.C.
${ }^{3}$ ) The rise-time is defined as the time interval between $10 \%$ and $90 \%$ of the final value of deflection when an ideal step-function signal is applied to the vertical deflection system. If the actual signal has an appreciable rise-time, $\tau_{2}$ the risetime of the tube can be determined from

$$
\boldsymbol{\tau}_{1}=\sqrt{\tau^{2}-\tau_{2}^{2}}
$$

where $\boldsymbol{T}$ is the rise-time observed on the display.
This should be measured after the angle between the $x$-traces and $y$-traces has been corrected by means of the correction coils, otherwise two measurements have to be taken (using either a different polarity of the vertical deflection signal or different direction of the time-base sweep) and the true value of $\tau$ has to be calculated as the arithmetic mean of the two results.
4) Deviations from the orthogonality of traces can be eliminated by means of correction coils.

## LINE WIDTH

## Notes to page 11

1) This voltage should be adjusted for optimum pattern geometry.
2) This voltage should be equal to the mean $x$-plate potential.
3) The range indicated corresponds to a scan magnification factor $M_{S C}$, i.e. the ratio by which the vertical deviation on the screen is increased, in the approximate range $1.8<\mathrm{M}_{\mathrm{Sc}}<2.0$, and the tube should not be operated outside this range. Within this range, line-width and screen current at a fixed value of the control-grid voltage are increasing functions of $\mathrm{M}_{\mathrm{SC}}$. The best compromise between brightness and line width is usually found at $\mathrm{M}_{\mathrm{SC}} \approx 1.9$ which corresponds to $\mathrm{V}_{\mathrm{g} 9-\mathrm{g}_{2}} \approx 310 \mathrm{~V}$.
4) For minimum defocusing of vertical lines near the upper and lower edges of the scanned area this voltage should be approximately adjusted to the value indicated. Since the value of $\mathrm{V}_{\mathrm{g} 8}-\mathrm{g}_{2}$ has some effect on the scan-magnification factor both $\mathrm{V}_{\mathrm{g} 8}$ and $\mathrm{V}_{\mathrm{g} 9}$ should be connected to $\mathrm{g}_{2}$ when the deviation without scan magnification is to be measured.
5) This voltage should be adjusted for equal brightness in the $x$-direction with respect to the electrical centre of the tube.
${ }^{6}$ ) By adjusting this voltage a spot not deflected in the vertical direction may be centered with respect to the vertical useful scan.
6) These voltages should be stabilized to within 1 V .
${ }^{8}$ ) This voltage should be adjusted for minimum width of a horizontal line.
7) For a scan-magnification factor $\mathrm{M}_{\mathrm{SC}}=1.9$. In the above mentioned range of $\mathrm{V}_{\mathrm{g} 9-\mathrm{g}_{2}}$ the vertical deflection factor will vary approximately $\pm 5 \%$.
8) The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
9) A rectangle of $98 \mathrm{~mm} \times 58.2 \mathrm{~mm}$ is concentrically aligned with the internal graticule of the tube. With optimum corrections applied, the edges of a raster will fall between this rectangle and the boundary lines of the internal graticule.

## CORRECTIONS COILS

The tube is provided with a coil unit consisting of:

1. A pair of coils (No.1 and 2), with approx. $220 \Omega$ D.C. resistance per coil, for
a) correction of the orthogonality of the $x$-and $y$-traces so that the angle between these traces at the centre of the screen can be made exactly $90^{\circ}$.
b) vertical shift of the scanned area.
2. A single coil (No.3) with approx. $550 \Omega$ D.C. resistance, for image rotation (alignment of the x -trace with the x -lines of the graticule).

## Orthogonality and shift

The change in the angle between the traces and the shift of the scanned area will be proportional to the algebraic sum and the algebraic difference of the currents in the coils No. 1 and 2.
Under typical operating conditions and with the coil unit closely surrounded by a mu-metal shield, the currents required are max. 5 mA per degree of angle correction and max. 2 mA per millimeter shift. The supply circuit for these coils should be so designed that in each coil a maximum current of 20 mA , with either polarity, can be produced.

If a wider mu-metal shield is used the above-mentioned values have to be multiplied by a factor $K(1<K<2)$ the value of which depends on the dimensions of the shield and approaches 2 for the case no shield is present.

## Image rotation

Under typical operating conditions, a current of max. 45 mA will be required for the alignment.

Fig. 1
With the above circuit almost independent control for shift and angle correction is achieved. This facilitates the correct adjustment to a great extent.
The dissipation in the potentiometers can be reduced considerably if the requirement of independent controls is dropped.

Fig. 2
$\mathrm{P}_{1}, \mathrm{P}_{2}$ potentiometers $220 \Omega$, 1 watt: ganged
$P_{3}, P_{4}$ potentiometers $220 \Omega$, 1 watt: ganged
A further reduction of the dissipation can be obtained by providing a commutator for each coil (see circuit fig.3).
The procedure of adjustment will then become more complicated but it should be kept in mind that a readjustment is necessary only when the tube has to be replaced.

Fig. 3
$P_{1}, P_{2}$ potentiometers $220 \Omega, 1$ watt
$\mathrm{S}_{1}, \mathrm{~S}_{2}$ commutators
A suitable circuit for the image rotating coil is given in fig.4.

Fig. 4
$\mathrm{P}_{5}, \mathrm{P}_{6}$ potentiometers $500 \Omega$, 3 watt: ganged

The following procedure of adjustment is recommended
a. Align the $x$-trace with the graticule by means of the image rotating coil.
b. With the tube fully scanned in the vertical direction, the image has to be shifted so that the graticule is fully covered. With the circuit according to fig. 1 this is done by means of the ganged potentiometers $\mathrm{P}_{1}$ and $\mathrm{P}_{4}$.
c. Adjustment of orthogonality by means of the ganged potentiometers $P_{2}$ and $P_{3}$. A slight readjustment of $P_{1}$ and $P_{4}$ may be necessary afterwards.
d. Readjustment of the image rotation if necessary.

With a circuit according to fig. 2 or 3 these corrections have to be performed by means of successive adjustments of the currents in the coils.
The most convenient deflection signal is a square wave form permitting an easy and fairly accurate visual check of orthogonality.

## ILLUMINATION OF THE GRATICULE

To illuminate the internal graticule a light conductor (e.g. of perspex) should be used. In order to achieve the most efficient light conductance, the holes for the lamps and the edge adjacent to the tube should be polished, and the distance between the perspex plate and the tube should be as small as possible. It is advisable to apply reflective material to the outer circumference and, if possible, also to the upper and lower faces of the light conductor. The thickness of the conductor should not exceed 3 mm , and its position relative to the frontplate of the tube should be adjusted for optimum illumination of the graticule lines.

1) Reflective material.
2) Polished.
3) Close and constant distance to front plate of tube .

It is essential that the light conductor and the front plate of the tube are in plane. 4) If possible reflective material.

## Notes

${ }^{1}$ ) In order to align the $x$-trace with the horizontal axis of the screen, the whole picture can be rotated by means of a rotation coil. This coil will have 50 amp . turns for the indicated max. rotation of $5^{\circ}$ and should be positioned as indicated in the drawing.
2) This tube is designed for optimum performance when operating at a ratio

```
Vg7/V}\mp@subsup{\textrm{g}}{2}{},\mp@subsup{\textrm{g}}{4}{}=6.
```

The geometry electrode voltage should be adjusted within the indicated range (values with respect to the mean $x$-plate potential).
A negative control voltage will cause some pincushion distortion and less background light, a positive control voltage will give some barrel distortion and a slight increase of background light.
3) The deflection plate shield voltage should be equal to the mean $y$-plate potential. The mean $x$ - and $y$-plate potentials should be equal for optimum spot quality.
4) The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessary adjustment its potential will be within the stated range.
${ }^{5}$ ) The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
6) A graticule, consisting of concentric rectangles of $95 \mathrm{~mm} \times 75 \mathrm{~mm}$ and 93 mm x 73.6 mm is aligned with the electrical $x$-axis of the tube. With optimum correction potentials applied a raster will fall between these rectangles.

## NOTES

1) In order to align the $x$-trace with the horizontal axis of the screen, the whole picture can be rotated by means of a rotation coil. This coil will have 50 amp . turns for the indicated max. rotation of $5^{0}$ and should be positioned as indicated on the drawing.
2) This tube is designed for optimum performance when operating at a ratio
$\mathrm{V}_{\mathrm{g}_{8}(\ell)} / \mathrm{V}_{\mathrm{g}_{2}, \mathrm{~g}_{4}}=6.7$
The geometry control voltage $\mathrm{V}_{\mathrm{g}}$ should be adjusted within the indicated range (values with respect to the mean x -plate potential).
A negative control voltage on $\mathrm{g}_{6}$ (with respect to the mean x -plate potential) will cause some pincushion distortion and less background light.
By the use of the two voltages, $\mathrm{V}_{6}$ and $\mathrm{V}_{\mathrm{g} 7}$, it is possible to find the best compromise between background light and raster distortion.
3) The deflection plate shield voltage should be equal to the mean $y$-plate potential. The mean $x$ - and $y$-plate potentials should be equal for optimum spot quality.
4) The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessary adjustment its potential will be within the stated range.
5) The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
${ }^{6}$ ) A graticule, consisting of concentric rectangles of $95 \mathrm{~mm} \times 75 \mathrm{~mm}$ and 93 mm x 73.6 mm is aligned with the electrical x axis of the tube. With optimum correction potentials applied a raster will fall between these rectangles.
6) To avoid damage to the side contacts the narrower end of the Mu-metal shield should have an internal diameter of not less than 64 mm .

## Notes

${ }^{1}$ ) To avoid damage to the side contacts the narrower end of the Mu-metal shield should have an internal diameter of not less than 64 mm .
${ }^{2}$ ) This tube is designed for optimum performance when operating at a ratio $\mathrm{V}_{\mathrm{g} 8(\ell)} /$ $\mathrm{V}_{\mathrm{g} 2, \mathrm{~g} 4}=6.7$
The geometry control voltage $\mathrm{V}_{\mathrm{g}}$ should be adjusted within the indicated range (values with respect to the mean x -plate potential).
A negative control voltage on $\mathrm{g}_{6}$ (with respect to the mean x -plate potential) will cause some pincushion distortion and less background light.
By the use of the two voltages, $\mathrm{V}_{6}$ and $\mathrm{V}_{\mathrm{g} 7}$, it is possible to find the best compromise between background light and raster distortion.
If a fixed voltage on $\mathrm{g}_{6}$ is required this voltage should be 10 V lower than the mean x -plate potential.
3) The deflection plate shield voltage should be equal to the mean $y$-plate potential. The mean $x$ - and $y$-plate potentials should be equal for optimum spot quality.
4) The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessary adjustment its potential will be within the stated range.
${ }^{5}$ ) The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
6) A graticule, consisting of concentric rectangles of $95 \mathrm{~mm} \times 75 \mathrm{~mm}$ and 93 mm x 73.6 mm is aligned with the electrical x axis of the tube. With optimum corrections applied a raster will fall between these rectangles.

## CORRECTION COILS

## General

The D14-160. . / 09 is provided with a coil unit consisting of: (see Fig. 1)

1. a pair of coils $\mathrm{L}_{3}$ and $\mathrm{L}_{4}$ which enable
a. the angle between the x and y traces at the centre of the screen to be made exactly $90^{\circ}$ (orthogonality correction);
b. the scanned area to be shifted up and down (vertical shift)
2. a pair of coils $\mathrm{L}_{1}$ and $\mathrm{L}_{2}$ for image rotation which enable the alignment of the x trace with the x lines of the graticule.

Fig. 1

Orthogonal ity and shift (coils L3 and L4)
The current required under typical operating conditions without the mu-metal shield being used is max. 45 mA for complete correction of orthogonality and shift. It will be $30 \%$ to $50 \%$ lower with shield, depending on the shield diameter. The resistance of each coil is approx. $225 \Omega$.

Image rotation (coils $\mathrm{L}_{1}$ and $\mathrm{L}_{2}$ )
The image rotation coils are wound concentrically around the tube neck.
Under typical operating conditions 50 A turns are required for the maximum rotation of $5^{\circ}$. Both coils have 850 turns. This means that a current of max. 30 mA percoil is required which can be obtained by using a 24 V supply when the coils are connected in series or a 12 V supply when they are in parallel.

Connecting the coils
The coils have been connected to the 8 soldering tags according to Fig. 2.

With $L_{3}$ and $L_{4}$ connected in series according to Fig. 3 a current in the direction indicated will produce a clockwise rotation of the vertical trace and an anti--clockwise rotation of the horizontal trace. With the connection according to Fig. 4 the current as indicated will produce an upward shift.

Fig. 2

Fig. 3

[^5]NOTES

1) In order to align the $x$-trace with the horizontal axis of the screen, the whole picture can be rotated by means of a rotation coil. This coil will have 50 amp . turns for the indicated max. rotation of $5^{\circ}$ and should be positioned as indicated in the drawing.
2) This tube is designed for optimum performance when operating at a ratio

$$
\mathrm{V}_{\mathrm{g}_{7}} / \mathrm{V}_{\mathrm{g}_{2}, \mathrm{~g}_{4}}=5
$$

The geometry electrode voltage should be adjusted within the indicated range (values with respect to the mean $x$-plate potential).
A negative control voltage will cause some pincushion distortion and less background light, a positive control voltage will give some barrel distortion and a slight increase of background light.
3) The deflection plate shield voltage should be equal to the mean $y$-plate potential. The mean $x$ - and $y$-plate potentials should be equal for optimum spot quality.
4) The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessary adjustment its potential will be within the stated range.
5) The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.

## REMARK

A contrast improving transparent conductive coating connected to the accelerator electrode is present between glass and fluorescent layer. This enables the application of a high potential with respect to earth to the accelerator electrode, without the risk of picture distortion by touching the face (electrostatic bodyeffect).

## D.7-11

1) This tube is designed for optimum performance when operating at the ratio $\mathrm{Vg}_{6}(l) \mathrm{Vg}_{4}=4$. Operation at other ratio may result in changes in deflection uniformity and geometry distortion. The geometry control electrode voltage should be adjusted for optimum performance. For any necessary adjustment its potential will be within the stated range.
2) The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessaryadjustment its potential will be within the stated range.
${ }^{3}$ ) The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
3) A graticule, consisting of concentric rectangles of $40.8 \mathrm{~mm} \times 40.8 \mathrm{~mm}$ and $39.2 \mathrm{~mm} \times 39.2 \mathrm{~mm}$ is aligned with the electrical x axis of the tube. The edges of a raster will fall between these rectangles with optimum correction potentials applied.
${ }^{5}$ ) Values to be taken into account for the calculation of the focus potentiometer.

1) This tube is designed for optimum performance when operating at the ratio $\mathrm{V}_{\mathrm{g}_{6}(\ell)} / \mathrm{V}_{\mathrm{g}_{4}}=4$. Operating at other ratio may result in changes in deflection uniformity and geometry distortion. The geometry control electrode voltage should be adjusted for optimum performance. For any necessary adjustment its potential will be within the stated range.
${ }^{2}$ ) The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessary adjustment its potential will be within the stated range.
2) The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
3) A graticule, consisting of concentric rectangles of $40.8 \mathrm{~mm} \times 40.8 \mathrm{~mm}$ and $39.2 \mathrm{~mm} \times 39.2 \mathrm{~mm}$ is aligned with the electrical x axis of the tube. The edges of a raster will fall between these rectangles with optimum correction potentials applied.
4) Values to be taken into account for the calculation of the focus potentiometer.

1) This tube is designed for optimum performance when operating at the ratio $\mathrm{Vg}_{8}(\ell) / \mathrm{V}_{\mathrm{g}_{5}}=3$. Operation at other ratio may result in changes in deflection uniformity and geometry distortion. The geometry control electrode voltage and the intergunshield voltage should be adjusted for optimum performance. For any necessary adjustment its potential will be within the stated range.
2) This voltage should be equal to the mean $x$ - and $y$ plates potential.
3) The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessary adjustment its potential will be within the stated range.
${ }^{4}$ ) The sensitivity at a deflection of less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
4) A graticule consisting of concentric rectangles of $60 \mathrm{~mm} \times 60 \mathrm{~mm}$ and 57 mm $\times 57 \mathrm{~mm}$ is aligned with electrical x axis of the tube. The edges of a raster will fall between these rectangles with optimum potentials applied.
${ }^{6}$ ) The deflection of one beam when balanced dc voltage are applied to the deflection plates of the other beam, will not be greater than the indicated value.
${ }^{7}$ ) With 50 mm vertical traces superimposed at the tube face centre and deflected horizontally $\pm 4 \mathrm{~cm}$ by voltages proportional to the relative deflection factors, horizontal separation of the corresponding points of the traces shall not be greater than the indicated value.

## INSTRUMENT CATHODE-RAY TUBE

10 cm diameter metal-backed flat-faced double gun oscilloscope tube with post-deflection acceleration by means of a helical electrode and low interaction between beams.

| QUICK REFERENCE DATA |  |  |  |

Cathode to all other elements and heate

## NOTES

1) This tube is designed for optimum performance when operating at a ratio $\mathrm{Vg}_{7(\ell)} / V_{\mathrm{g}_{2}, \mathrm{~g}_{4}}=6.7$.
The geometry control voltage $\mathrm{V}_{\mathrm{g}_{6}}$ should be adjusted within the indicated range (values with respect to the mean $x$-plate potential).
2) A negative control voltage on $g_{5}$ (with respect to the mean $x$-plate potentiai) will cause some pincushion distortion and less background light. By varying the two voltages $\mathrm{V}_{\mathrm{g}_{5}}$ and $\mathrm{V}_{\mathrm{g}_{6}}$ it is possible to find the best compromise between background light and raster distortion.
3) The astigmatism control electrode voltage should be adjusted for optimum spot shape. For any necessary adjustment its potential will be within the stated range.
4) The sensitivity at a deflection less than $75 \%$ of the useful scan will not differ from the sensitivity at a deflection of $25 \%$ of the useful scan by more than the indicated value.
5) A graticule, consisting of concentric rectangles of $100 \mathrm{~mm} \times 80 \mathrm{~mm}$ and 96 mm x 77 mm is aligned with the electrical x -axis of the tube. With optimum correction potentials applied a raster of each system will fall between these rectangles.
${ }^{6}$ ) The beam centring magnet should be adjusted for equal intensity of the two traces.

## SCREENS

Although W is the standard screen, certain applications require screens of a different persistence and/or colour (e.g. GH, GR, GM).
Tubes with such screens are supplied to special order.

## MONITOR TUBE

17 cm flat-faced rectangular picture tube primarily intended for use as a viewfinder in television cameras.

## PICTURE CENTRING MAGNET

Field intensity perpendicular to the tube axis adjustable from 0 to $800 \mathrm{~A} / \mathrm{m}$ ( 0 to 10 Oe ). Adjustment of the centring magnet should not be such that a general reduction in brightness or shading of the raster occurs.

## NOTES

1) The reference line is determined by the plane of the upper edge of the of the flange of reference line gauge when the gauge is resting on the cone.
${ }^{2}$ ) The maximum dimension is, determined by the erference line gauge.
2) Deflection coil ATIO40 is recommended. If another coil is considered, it is advisalt.
3) Deflection coil ATI040 is recommended. If another coil is considered, it is advisable to contact the local tube supplier.
${ }^{4}$ ) The bulge at the spliceline seal may increase the indicated maximum values for envelope width, diagonal and height by not more than 6.4 mm , but at any point around the seal the bulge will not protude more than 3.2 mm byond the envelope surface.

The socket for the base should not be rigidly mounted, it should have flexible leads and be allowed to move freely.

Notes see page 4

## NOTES TO OUTLINE DRAWING

1. The reference line is determined by the plane of the upper edge of the flange of the reference line gauge when the gauge is resting on the cone.
2. The configuration of the external conductive coating may be different but contains the contact area shown in the drawing.
The external conductive coating must be earthed.
3. End of guaranteed contour. The maximum neck and cone contour is given by the reference line gauge.
4. This area must be kept clean.
5. Recessed cavity contact I.E.C. 67-III-2.
6. The displacement of any lug with respect to the plane through the three other lugs is max. 2 mm .
7. The mounting screws in the cabinet must be situated inside a circle of 7 mm diameter drawn around the true geometrical positions, i.e. at the corners of a rectangle of $267.5 \mathrm{~mm} \times 204.4 \mathrm{~mm}$.
8. The metal band must be earthed by means of the tag provided. No electrical contact between the metal band and the mounting lug can be guaranteed.

| $\mathrm{V}_{\mathrm{g}_{4}}$ | 0 to 500 V |
| $\mathrm{~V}_{\mathrm{g}_{2}}$ | 600 V |
| $-\mathrm{V}_{\mathrm{g}_{1}}$ | 43 to 98 V |
| $\mathrm{~V}_{\mathrm{k}}$ | 40 to 90 V |

## RESOLUTION

Resolution at screen centre min. 650 lines
Measured at:

| $\mathrm{Vg}_{3}, \mathrm{~g}_{5}(\ell)$ | 16 kV |
| :--- | ---: |
| $\mathrm{g}_{2}$ | 600 V |

This tube will resolve 650 lines measured at a brightness of 340 Nits based on a picture height of 237 mm .
The focus voltage is adjusted to obtain the smallest roundest spot. For optimum overall resolution an external centring magnet may be required.

## WARNING

X-ray shielding is advisable to give protection against danger of personal injury arising from prolonged exposure at close range to this tube.

## MECHANICAL DATA

1) Reference line is determined by the plane of the upper edge of the flange of the reference line gauge when the gauge is resting on the cone.
${ }^{2}$ ) The maximum dimension is determined by the reference line gauge.

First accelerator voltage
Grid No. 1 voltage for visual extinction of a focused raster
Resolution at screen centre
Measured at

| $\mathrm{V}_{\mathrm{g}_{3}, \mathrm{~g}_{5}}{ }^{(\ell)}$ | 16 | kV |
| :---: | :---: | :---: |
| $\mathrm{V}_{4}$ | 0-400 | V |
| $\mathrm{Vg}_{2}$ | 400 | V |
| $-\mathrm{V}_{\mathrm{g}}$ | $\begin{array}{r} 40 \text { to } 85 \\ \min .625 \end{array}$ | V lines |
| $\mathrm{V}_{\mathrm{g}_{3}, \mathrm{~g}_{5}}(\ell)$ | 16 | kV |
| $\mathrm{Vg}_{2}$ | 400 | V |

This tube will resolve 625 lines measured at a brightness of 340 Nits based on a picture height of 237 mm .
The focus voltage is adjusted to obtain the smallest roundest spot. For optimum overall resolution an external centring magnet may be required.

## WARNING

X-ray shielding is advisable to give protection against possible danger of personal injury arising from prolonged exposure at close range to this tube when operated above 16 kV .

Mounting position: any, except vertical with the screen downward and the axis of the tube making an angle of less than $20^{\circ}$ with the vertical.

| $\frac{\text { Base }}{}$ | Neo eightar (B8H) |
| :--- | :--- | :--- |
| Cavity contact | CT8 |

The range of focus voltage shown under "Typical operating conditions" results in optimum focus at a beam current of $100 \mu \mathrm{~A}$.

[^15]
## WARNING

X-ray shielding is advisable to give protection against possible danger of personal injury arising from prolonged exposure at close range to this tube when operated above 16 kV .

## EXTERNAL CONDUCTIVE COATING

This tube has an external conductive coating ( $m$ ), which must be earthed and capacitance of this to the final electrode is used to provide smoothing for the EHT supply. The tube marking and warning labels are on the side of the cone opposite the final electrode connector and this side should not be used for making contact to the external conductive coating.

## NOTES TO OUTLINE DRAWING

${ }^{1}$ ) The reference line is determined by the plane of the upper edge of the flange of reference line gauge, (JEDEC 126) when the gauge is resting on the cone.
${ }^{2}$ ) End of guaranteed contour. The maximum neck and cone contour is given by the Reference line gauge (see page 4).
${ }^{3}$ ) Bulge at splice-line seal may increase the indicated maximum value for envelope width, diagonal and height by not more than 6.4 mm , but at any point around the seal, the bulge will not protrude more than 3.2 mm beyond the envelope surface at the location specified for dimensioning the envelope width, diagonal and height.
4) The tube should be supported on both sides of the bulge. The mechanism used should provide clearance for the maximum dimensions of the bulge.
${ }^{5}$ ) The maximum dimension is determined by the reference line gauge.

## CATHODE-RAY TUBES

## C-R tubes for special applications

## PROJECTION TUBE

The M. 13-38 are 13 cm diameter projection tubes.
The tubes are designed for large screen projection of colour TV displays.

1) In order to prevent the possible occurrence of cracked faces, for images with concentrated bright areas (high screen loads) the $g_{2}$ current should be kept lower than the indicated value. This is especially the case as for as stationary pictures are concerned.
2) In order to avoid excessive hum, the A.C. component of the heater to cathode voltage should be as low as possible and must not exceed 20 VRMS.

## GENERAL OBSERVATIONS

It is essential that means be provided for the instantaneous removal of the beam current in the event of a failure of either one or both of the time bases. Unless such a safety device is incorporated a failure of this type will result in the immediate destruction of the screen of the tube.

Shielding equivalent to a lead thickness of 1 mm is required to protect the observer against X radiation.
The raster dimensions should not come below the minimum of $69 \times 72 \mathrm{~mm}^{2}$. The screen shall be given adequate cooling by applying a continuous airblast onto the screen of approx. $0.06 \mathrm{~m}^{3} / \mathrm{sec}$.

In order to prevent damage of the tube caused by a momentary internal arc a resistor of $50 \mathrm{k} \Omega$ has to be connected between anode contact and the power supply.

Before removing the tube, the screen and the cone should be discharged.
The spark trap and the outer coating of the tube must be connected to earth. It is necessary to centre the focusing coil to get optimum sharpness.
It is recommended to use the E.H.T. connector, which is delivered with each tube.

## PROJECTION TUBE

The MW13-38 is a 13 cm diameter projection tube.
The brightness of the tube is such that it can be used for large screen projection of TV displays.

## GENERAL OPERATIONAL NOTES CAMERA TUBES VIDICONS

## A. PRINCIPLES OF OPERATION OF VIDICONS WITH MAGNETIC FOCUSING; MAGNETIC DEFLECTION

1. With integral mesh

Mechanical design
The schematic arrangement of the vidicon with its accessories is shown in Fig. 1.
The vidicon may be assumed to consist of three sections, namely the electron gun, the scanning section, and the target section.

Fig.1. Schematic electrode and coil arrangement
The electron gun contains a thermionic cathode, a grid $g_{1}$ controlling the beam current, and a limiter electrode $g_{2}$ which accelerates the electrons and releases them in a fine beam through its diaphragm.

The scanning section. The electron beam released by $g_{2}$ enters the space enclosed by the cylindrical electrode $g_{3}$. By means of the combined action of the adjustable electrical field of $g_{3}$ (beam focus control) and a fixed axial magnetic field produced by the focusing coil, the electrons are focused in one loop on to the target.

The far end of the $g_{3}$ cylinder is closed with a fine metal mesh, $g_{4}$, electrically connected to $g_{3}$, which produces a uniform, decelerating field in front of the target. The focused beam is magnetically deflected by two pairs of deflection coils so that it scans the target. Proper alignment of the beam with the axial magnetic field is achieved by either an adjustable magnet, or, as shown in Fig.1, by two sets of alignment coils producing an adjustable transverse magnetic field.

The target section is illustrated in Fig.2. It consists of:

- an optically flat glass faceplate,
- a transparent conductive film on the inner surface of the faceplate, connected electrically to the external signal-electrode ring,
- a thin layer of photoconductive material deposited on the conductive film; in the dark this material has a high specific resistance, which decreases with increasing illumination.
The optical image to be televised is focused on the conductive film by means of a lens system.

Fig.2. Target section

## Operation

The external signal-electrode ring is connected via a load resistor to a positive voltage in the order of 40 V (see Fig.3).

The target may be assumed to consist of a large number of target elements corresponding to the number of picture elements. Each target element consists of a small capacitor ( $\mathrm{C}_{\mathrm{e}}$ ), connected on one side to the signal electrode via the transparent conductive film and shunted by a light-dependent resistor $\left(\mathrm{R}_{1 \mathrm{~d}}\right)$, see Fig.3).
When the target is scanned by the beam its surface will be "stabilized" at approximately the cathode potential (low-velocity stabilization) and a potential difference will be established across the photoconductive layer, inother words, each elementary capacitor will be charged to nearly the same potential as applied to the electrode ring.
In the dark, the photoconductive material is a fairly good insulator, so that only a minute

Fig. 3 fraction of the charge of the elementary capacitors will leak away between successive scans. This charge will be restored by the beam; the resulting current to the signal electrode is termed "dark current".

When an optical image is focused on to the target, those target elements which are illuminated will become more conductive and will be partly discharged. As a consequence a pattern of positive charges corresponding to the optical image will be produced on the side of target facing the gun section.

While scanning this charge pattern the electron beam will deposit electrons on the positive elements until the latter are restored to their original cathode potential, causing a capacitive current to the signal electrode and hence a voltage across the load resistor $\mathrm{R}_{\mathrm{L}}$. This voltage, negative going for the highlights, is the video signal and is fed to the pre-amplifier.
A vidicon is called "stabilized" when the magnitude of the beam current applied is just sufficient to restore the scanned surface to cathode potential, so that all elementary capacitors, including those at the highlights in the image, are recharged successively.
During the retrace periods the beam electrons should be prevented from landing on the target since otherwise the scan retraces will appear as dark lines in the picture obtained on the monitor. This may be achieved either by cutting off the beam with suitable negative blanking pulses on the control grid or by cutting off the target with adequate positive blanking pulses applied to the cathode.

## 2. With a separate mesh construction

The focus coils commonly used in vidicon cameras do not produce an ideal focus field distribution in the vicinity of the vidicon's photoconductive target.

The resulting "landing errors" of the scanning beam reduce the sensitivity and resolution at the periphery of the picture. The beam landing errors can be corrected by electron-optical means. A lens for this purpose may be formed by the cylindrical electrode $\left(g_{3}\right)$ and the mesh electrode ( $g_{4}$ ). In the vidicons with a separate mesh electrode $g_{4}$ is electrically insulated from $g_{3}$ and connected to a separate base pin.

The mesh electrode $\left(g_{4}\right)$ should be made positive with respect to the cylindrical electrode ( $\mathrm{g}_{3}$ ); the optimum potential difference depends on:
a. the operating mode of the vidicon (choice of the focusing field and $\mathrm{V}_{3}$ );
b. the particular type of deflection coil unit used.

As a rule, to obtain the best resolution and most uniform whites the $\mathrm{V}_{\mathrm{g}_{4}}$ should be from 1.3 to 1.5 times higher than $V_{g_{3}}$. Fig. 4 shows a typical curve revealing the effect of the ratio $\mathrm{V}_{4} / \mathrm{V}_{\mathrm{g}_{3}}$ on the resolution measured on a vidicon type XQ1240 in a coil unit type AT1102/01. The fall-off in resolution at $\mathrm{Vg}_{4} / \mathrm{V}_{3}=1$, corresponding to the situation with conventional vidicons, is caused by the defocusing effect of a space charge at the cathode side of the mesh electrode, produced by secondary electrons released from the mesh. This space charge can be prevented from building up by making $g_{4}$ at least 15 Volts positive relative to $g_{3}$.

Fig.4. Effect of the $\mathrm{V}_{4} / \mathrm{V}_{\mathrm{g} 3}$ ratio on the resolution of a vidicon type XQ1240.

Operation of $g_{4}$ at a negative potential with respect to $g_{3}$ must be avoided in any case, since this would inflict permanent damage on the target, due to ion bombardment. A higher potential applied to $g_{4}$ will slightly raise the required deflection currents but these will usually remain well within the ratings of the camera deflection circuits.

Caution. If the camera wiring has been adapted) for the use of vidicons with separate mesh, insertion of an integral-mesh vidicon will result in normal performance of the tube and do no harm to the tube or the wiring of the camera. However, it should be borne in mind that the insertion of a separatemesh vidicon in an unmodified camera may be detrimental to the vidicon, its target being damaged by ion bombardment; moreover, performance will be unsatisfactory.
) A leaflet is available on request giving suggestions for making cameras suitable for incorporating separate-mesh tubes.

## B. EQUIPMENT DESIGN AND OPERATING CONSIDERATIONS

The signal electrode connection should be made by a spring contact which bears against the metal ring at the face end of the tube. The spring contact may be provided as part of the focusing coil design.
The signal-electrode voltage should be limited to such a value that the peak dark current does not exceed $0.25 \mu \mathrm{~A}$.

This is of particular importance for the design and adjustment of vidicon cameras with automatically controlled sensitivity (automatic control of the signalelectrode voltage).

Operation of vidicons at excess dark current will result in damage to the photoconductive target and hence shorten the tube life.

The deflection yoke and the focus coil used must be so designed that the beam lands perpendicularly to the target at all points of the scanned area, to ensure high uniformity of sensitivity and focus.

The deflection circuits must provide constant scanning speeds in order to obtain good black-level reproduction. The dark-current signal being proportional to the velocity of scanning, any change in this velocity will produce a black-level error.

The polarity of the focusing coil should be such that a north-seeking pole is attracted to the image end of the focusing coil, with this pole located outside of and at the image end of the focusing coil.

The alignment coil assembly should be located on the tube so that its centre is at a distance of approx. $94 \mathrm{~mm}\left(3^{\prime} 11 / 16 \mathrm{in}\right)$ from the face of the tube, and be positioned so that its axis coincides with the axis of the tube, the deflecting yoke and the focusing coil.

The temperature of the faceplate should never exceed $80^{\circ} \mathrm{C}$, either during operation or storage. Operation at a faceplate temperature of 25 to $35^{\circ} \mathrm{C}$ is recommended.

The temperature of the faceplate is determined by the heating effects of the incident illumination, the associated components and the environment and, to a minor extent, by the tube itself.

To reduce these heating effects and to permit operation in the preferred temperature range under conditions of high light levels, respectively high ambient temperatures, the use of an infra-red filter between object and camera lens, or a flow of cooling air directed across the faceplate, is recommended.

## Scanning amplitude

Full-size scanning of the $9.6 \mathrm{~mm} \times 12.8 \mathrm{~mm}$ area of the photoconductive layer should always be applied.
Underscanning of the photoconductive layer, i.e. scanning of an area of less than $9.6 \mathrm{~mm} \times 12.8 \mathrm{~mm}$ or failure of scanning for even a short duration should always be avoided, since this may cause permanent damage to the specified fullsize area.

The resolution of a vidicon increases with increasing $\mathrm{V}_{\mathrm{g}_{3}}$ and $\mathrm{V}_{\mathrm{g}_{4}}$. In general grid 3 and 4 should be operated above 250 V .
In the low voltage mode $\left(\mathrm{V}_{\mathrm{g}_{3}}=\mathrm{V}_{\mathrm{g}_{4}}=275 \mathrm{~V}\right.$ for integral mesh tubes; $\mathrm{V}_{3}=275 \mathrm{~V}$ and $V_{g_{4}}=385 \mathrm{~V}$ for separate mesh tubes in the coil unit AT1102/01) the current through the focusing should be such as to provide an axial magnetic fieldstrength of approximately $3200 \mathrm{~A} / \mathrm{m}$ ( 40 Oe ).
A substantial increase in both limiting resolution and amplitude response may be obtained by operating the tube in the high voltage mode $\left(\mathrm{Vg}_{4}=\mathrm{Vg}_{3}=600 \mathrm{~V}\right.$ for integral mesh tubes, $\mathrm{V}_{\mathrm{g}_{3}}=600 \mathrm{~V}$ and $\mathrm{V}_{\mathrm{g}_{4}}=840 \mathrm{~V}$ for separate mesh tubes. and an axial magnetic field of approximately $5500 \mathrm{~A} / \mathrm{m}$ ( 70 Oe ).

Since beam-landing errors increase with increasing $\mathrm{Vg}_{3}$ and $\mathrm{V}_{4}$, such operation will show a reduced signal output in the corners of the scanned area. When a vidicon with integral mesh is operated in this manner, the deflecting and focusing coils employed must be designed in such a way that beam-landing errors are minimized.

Compensation of residual beam-landing errors can be obtained by supplying modulating voltages of parabolic shape and of both horizontal and vertical scanning frequencies to the cathode and additionally, in order to prevent beam-modulation, to g1 and g2.

A suitable amplitude for this mixed parabolic waveform is approximately 4 V peak-to-peak. The polarity should be chosen such that the potential of the cathode is lowered as the beam approaches the edges of the scanned area. The use of this modulating waveform also improves the centre-to-edge focus of the vidicon.

Operation in the high voltage mode requires increased power for the deflecting and focusing coils, which will result in a higher tube temperature unless adequate provisions for cooling are made. Compensation of beam-landing errors by means of mixed modulating voltages of parabolic shape applied to the cathode is in general not needed for vidicons with separate mesh since the beam-landing errors may be sufficiently reduced by a proper choice of the $\mathrm{V}_{\mathrm{g}_{4}} / \mathrm{V}_{\mathrm{g}_{3}}$ ratio.
C. INSTRUCTIONS FOR USE FOR VIDICONS WITH MAGNETIC FOCUSING AND MAGNETIC DEFLECTION

1. In the case of a separate-mesh vidicon make certain that the camera. is adapted for separate-mesh vidicons.
2. Clean the faceplate of the tube.
3. Insert the tube in the deflection unit so that the direction of the horizontal scan is essentially parallel to the plane defined by the short index pin and the longitudinal axis of the tube.
4. Press the socket firmly onto the base pins.
5. Cap lens and close iris.
6. Set: (a) grid No. 1 bias control at maximum negative bias (beam cut-off)
(b) signal-electrode voltage to approximately 25 V
(c) scanning amplitude to maximum scan.
7. Switch on camera equipment and monitor; allow a few minutes for heating up.
8. Adjust monitor to produce a faint, non overscanned, raster.
9. Direct camera to the scene to be televised and uncap lens.
10. Turn grid No. 1 bias-control slowly till a picture is produced on the monitor. If this picture appears washed out, increase beam current. If the picture is too faint, increase lens aperture.
11. Adjust beam focus ( $\mathrm{Vg}_{3}, \mathrm{~V}_{\mathrm{g} 4}$ for integral-mesh tubes, $\mathrm{V}_{3}$ for separatemesh tubes) and optical focus alternately for best possible focus.
12. Adjust scanning amplitudes:
(a) by means of a mask of $9.6 \mathrm{~mm} \times 12.8 \mathrm{~mm}$, which is in contact with and centred at the faceplate. Decrease horizontal and vertical deflecting currents till the periphery of this mask is just outside the raster on the
monitor. This procedure may be facilitated by small adjustments of the centring controls;
(b) if no mask is available, direct the camera to a test chart having correct aspect ratio ( $3: 4$ ) and adjust the centring controls in such a way that the target ring is just visible in the corners of the picture. Adjust distance from camera to test chart and optical focus alternately till the picture of the test chart completely fills the scanned raster on the monitor.

13. Adjust alignment controls so that the centre of the picture does not move when beam focus $\left(V_{g_{3}}\right.$ and $V_{g}$ for integral-mesh tubes, $V_{g}$ for separatemesh tubes) is varied.
14. Cap lens and adjust signal-electrode voltage to such a value that further increase would cause the background signal to become objectionally high or non-uniform.
15. Uncap lens. Adjust beam focus control for optimal picture uniformity in respect of picture whites and resolution.
16. Adjust iris for a picture of sufficient contrast and adjust beam current to the minimum value which will give details in the picture highlights.
17. Check alignment, beam focus and optical focus.

Always:

- make sure the camera wiring is adapted for a separate-mesh tube before installation;
- make sure that the deflection circuits are operative before adjusting beam current;
- maintain the same scanned target area, hence avoid rotating the tube;
- use full size ( $9.6 \mathrm{~mm} \times 12.8 \mathrm{~mm}$ ) scanning of the target, hence avoid underscanning;
- use sufficient beam current to stabilize the picture highlights;
- adjust $\mathrm{Vg}_{4}$ of separate-mesh tubes to a value positive with respect to $\mathrm{Vg}_{3}$;
- avoid peak-dark currents in excess of $0.25 \mu \mathrm{~A}$;
- avoid directing the camera at the sun;
- keep lens capped when transporting the camera.
D. PROPERTIES OF THE PHOTOCONDUCTIVE TARGETS AS USED IN THE XQ1010, XQ1031/1032, XQ1240/1241 (Photoconductive targets type A ) Spectral response
The spectral response of the targets used in the above tubes is shown in Fig.6.

Fig. 6

Dark current
The range of dark currents determined at a faceplate temperature of $30 \pm 2{ }^{\circ} \mathrm{C}$ is shown in Fig. 7. ${ }^{1}$ ).

Fig. 7

1) The XQ1240 is selected for a narrower range ( see data sheets ).

## Transfer characteristics

The light transfer characteristics of a typical vidicon with three dark current settings as parameters are given in Fig. 8.

Section A Vidicons for telecine, other broadcast applications and critical industrial applications.

## Test conditions

1. A back illuminated test transparency, with a aspect ratio of $3: 4$, with threequal ity zones (see Fig.1) is projected onto the specified target area ( $9.6 \times 12.8 \mathrm{~mm}^{2}$ ), producing even illumination.

Fig. 1

2. Light level adjusted to produce a total target current of $0.3 \mu \mathrm{~A}$, target voltage adjusted for a dark current of approx. 20 nA , temperature $30^{\circ} \pm 2^{\circ} \mathrm{C}$, colour temperature of light source $2854{ }^{\circ} \mathrm{K}$.
3. Tube aligned and focused in accordance with the published instructions for use.
4. Video-amplifier system having a bandwidth of 5.5 MHz .
5. Monitor adjusted for a non-blooming white.
6. In the evaluation of blemishes the following definitions apply:
a) a spot (black or white) is a blemish with a maximum linear dimension measured in any direction of $0.75 \%$ of the picture height ( $0.8 \%$ for industrial grade tubes, $1 \%$ for low cost tubes)
b) a smudge (blackor white) is a blemish with a maximum linear dimension measured in any direction exceeding $0.75 \%$ of picture height ( $0.8 \%$ for industrial grade tubes, $1 \%$ for low cost tubes)
Permitted number, size and location of blemishes ${ }^{1}$ )

## RATING SYSTEM

## ABSOLUTE MAXIMUM RATING SYSTEM

Absolute maximum ratings are limiting values of operating and environmental conditions applicable to any electronic device of a specified type as defined by its published data, which should not be exceeded under the worst probable conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device, taking no responsibility for equipment variations, environmental variations, and the effects of changes in operating conditions due to variations in the characteristics of the device under consideration and of all other electronic devices in the equipment.

The equipment manufacturer should design so that, initially and throughout life, no absolute maximum value for the intended service is exceeded with any device under the worst probable operating conditions with respect to supply voltage variation, equipment component variation, equipment control adjustment, load variations, signal variation, environmental conditions, and variations in characteristics of the device under consideration and of all other electronic devices in the equipment.

## CAMERA TUBE

Vidicon television camera tube with electrostatic deflection and electrostatic focusing and ruggedized construction; intended for use in compact TV systems in industrial and other applications.

| QUICK REFERENCE DATA |  |  |  |
| :--- | ---: | :--- | :---: |
| Separate mesh |  |  |  |
| Focusing | electrostatic |  |  |
| Deflection | electrostatic |  |  |
| Construction | ruggedized |  |  |
| Diameter | 25.4 | $\mathrm{~mm}(1 \mathrm{in})$ |  |
| Length | 158 | $\mathrm{~mm}\left(6 \frac{1}{4} \mathrm{in}\right)$ |  |
| Heater | $6.3 \mathrm{~V}, 300$ | mA |  |
| Resolution | $\geq 600$ | TV lines |  |

## OPTICAL

Diagonal of quality rectangle on photoconductive layer (aspect ratio 3:4) max. 16 mm

## Orientation of image on photoconductive layer:

The direction of the horizontal scan is essential parallel $\pm 5^{\circ}$ to the plane defined by pin no. 2 and the longitudinal tube axis.
Spectral response, max. response at approx. 550 nm

## HEATING

Indirect by A.C. or D.C.; parallel and series supply

| Heater voltage | $\mathrm{V}_{\mathrm{f}}$ | 6.3 | $\mathrm{~V} \pm 10 \%$ |
| :--- | :--- | :--- | :--- |
| Heater current | $\mathrm{I}_{\mathrm{f}}$ | 300 | mA |

When the tube is used in a series heater chain, the heater voltage must not exceed $9.5 \mathrm{~V}_{\mathrm{rms}}$ when the supply is switched on.

## CAPACITANCES

Signal electrode to all

The capacitance $\mathrm{C}_{\mathrm{as}}$, which effectively is the output impedance of the tube increases when the tube is inserted into a shield.

## MECHANICAL DATA

Dimensions in mm

$x_{1}$ to $x_{2}$
$y_{1}$ to $y_{2}$

LIMITING VALUES (Absolute max. rating system)
for scanned area of $9.6 \mathrm{~mm} \times 12.8 \mathrm{~mm}(3 / 8 \mathrm{in} \times 1 / 2 \mathrm{in})$
"Full-size scanning" i.e. scanning of a $9.6 \mathrm{~mm} \times 12.8 \mathrm{~mm}$ area of the photoconductive layer should always be applied. The use of a mask having these dimensions is recommended. Underscanning, i.e. scanning of an area less than $9.6 \mathrm{~mm} \times 12.8 \mathrm{~mm}$, may cause permanent damage to the specified full-size area.

## NOTES

1. Average d.c. voltage of the four deflection electrodes before correction for astigmatism. $\left(\Delta V_{\mathrm{xy}}\right)$.
2. Some centring of the scanned area on the target will generally be needed. The d.c. voltage differences between the electrodes $x_{1}$ and $x_{2}\left(\Delta V_{x_{1}} x_{2}\right)$ and the electrodes $y_{1}$ and $y_{2}\left(\Delta V_{y_{1}}, y_{2}\right)$ needed for centring will not exceed the quoted value.
3. Astigmatism correction may be achieved by applying a voltage difference ( $\Delta V_{x y}$ ) between the $x$ deflection electrode pair and the $y$ deflection electrode pair. This correction is obtained with a voltage difference $\Delta V_{x y}$ not exceeding the quoted value.
4. Signal electrode voltage set for a dark current of 20 nA .
5. Measured with a video amplifier system having an appropriate bandwidth.
6. Square wave response. Typical values for the tube proper, after correction for faults introduced by the optical system, measured with a peak signal current $I_{S p}=0.2 \mu \mathrm{~A}$.
7. Corners defined as 0.35 of diagonal from centre.

## SHOCK AND VIBRATION

Shock
The tube will function satisfactorily after having been subjected 3 times in each of 6 directions to a shock pulse of 30 g , duration 11 ms .
The directions are:

## Vibration

The tube will function satisfactorily when vibrated at 25 Hz to 500 Hz with an acceleration of 20 g in each of three mutually perpendicular directions one of which coincides with the longitudinal axis of the tube. The rate of change of frequency is logarithmic and such that a complete cycle occupies approximately 10 minutes. The duration of the test is 12 complete cycles in each of 3 directions.

## CAMERA TUBE

Plumbicon*, sensitive high-definition pick-up tube with photoconductive target and low velocity stabilization.
The XQ1020 is intended for use in black and white, the L, R, G, and B versions for in four and three tube colour studio cameras.

## NOTES

1) Underscanning of the specified useful target area of $12.8 \mathrm{~mm} \times 17.1 \mathrm{~mm}$, or failure of scanning, should be avoided since this may cause damage to the photo-conductivelayer.
${ }^{2}$ ) For correct orientation of the image on the photoconductive layer the horizontal scan should be essentially parallel to the plane passing through the tube axis and the index pin.
2) Measuring conditions:

Illumination 4.541 x at black body colour temperature of 2850 K ; the appropriate filter inserted in the light path. The signal current obtained in nA is a measure of the colour sensitivity expressed in $\mu \mathrm{A}$ per lumen of white light before the filter. Filters used:

| 55875R | Schott | OG2 | thickness | 3 mm |
| :--- | :--- | :--- | :--- | :--- |
| 55875G | Schott | VG9 | thickness | 1 mm |
| 55875B | Schott | BG12 | thickness | 3 mm |

See page 8 for transmission curves.
${ }^{4}$ ) a) Gamma is, to a certain extent, dependent on the wavelength of the illumination applied.
b) The use of gamma-stretching circuitry is recommended.
${ }^{5}$ ) The capacitance $\mathrm{C}_{\mathrm{a}_{\mathrm{S}}}$ to all, which effectively is the output impedance, increases when the tube is inserted into the deflecting/focusing coil assembly.
${ }^{6}$ ) For focusing/deflection coil assembly, see under "Accessories".
${ }^{7}$ ) Without blanking voltage on grid No. 1.
${ }^{8}$ ) At $V_{k}=0 \mathrm{~V}$.
${ }^{9}$ ) For short intervals. During storage the tube face shall be covered with the plastic hood provided; when the camera is idle the lens shall be capped.
10) The signal electrode voltage shall be adjusted to 45 V . To enable the tube to handle excessive highlights in the scene to be televised the signal electrode voltage may be reduced to a minimum of 25 V , this will, however, result in some reduction in performance, especially in respect of sensitivity.
${ }^{11)}$ The beam current shall be adjusted for correct stabilization of the highlight signal currents stated in the table.
12).

Black/white coil assembly AT1132 and 312210868300 $\mathrm{Vg}_{3}=550$ to $600 \mathrm{~V}, \mathrm{Vg}_{4}=675 \mathrm{~V}$
Colour coil assemblies Af1112, AT1113, AT1113/01
$\mathrm{V}_{\mathrm{g}_{3}}=550$ to $600 \mathrm{~V}, \mathrm{Vg}_{4}=675 \mathrm{~V}$

| Focus <br> current <br> mA | Line <br> current <br> $\mathrm{mA}_{\mathrm{pp}}$ | Focus <br> current <br> $\mathrm{mA}_{\mathrm{pp}}$ |
| :---: | :---: | :---: |
| 25 | 235 | 35 |
| 100 | 235 | 35 |

(approx. values)

The optimum voltage ratio $\mathrm{V}_{\mathrm{g}_{4}} / \mathrm{Vg}_{3}$ depends on the type of focusing/deflection coil used: for types AT1112, AT1113, AT1113/01, AT1132, 312210868300 a ratio of $1.1: 1$ to $1.15: 1$ is recommended.
13) Typical faceplate illumination level for the XQ1020 and XQ1020L to produce $0.3 \mu \mathrm{~A}$ signal current will be approx. 4 lx . The signal currents stated for the colour tubes XQ1020R, G, B respectively will be obtained with an incident white light level ( 2850 K ) on the filter of approx. 10 lx . These figures are based on the filters described in note 3 , for filter BG 12 however a thickness of 1 mm is chosen.
${ }^{14}$ ) In the case of a black/white camera the illumination on the photoconductive layer, $\mathrm{B}_{\mathrm{ph}}$, is related to scene illumination, $\mathrm{B}_{\mathrm{Sc}}$, by the formula:

$$
\mathrm{B}_{\mathrm{ph}}=\mathrm{B}_{\mathrm{Sc}} \frac{\mathrm{R} \cdot \mathrm{~T}}{4 \mathrm{~F}^{2}(\mathrm{~m}+1)^{2}}
$$

in which R represents the average scene reflectivity or the object reflectivity, whichever is relevant, T the lens transmission factor. F the lens aperture, and m the linear magnification from scene to target.
A similar formula may be derived for the illumination level on the photoconductive layers of the R, G, and B tubes in which the effects of the various components of the complete optical system have been taken into account.
15) The horizontal amplitude response can be raised by the application of suitable correction circuits, which affects neither the vertical resolution, nor the limiting resolution.
16) The stated ratio represents the "visual equivalent signal-to-noise ratio", which is taken as the ratio of highlight video-signal current to RMS noise current, multiplied by a factor of 3 , assuming an RMS noise current of the video pre-amplifier of 2 nA , bandwidth 5 MHz .

## GENERAL RECOMMENDATIONS

1. During transport, handling and storage the axis of the Plumbicon must be either vertical, with faceplate up, or horizontal ; the faceplate should be covered with the hood provided.
2. To avoid damage to the tungsten basepins, the Plumbicon should be inserted in its socket with care. Shocks, undue force, and bending loads on the pins are to be avoided.
3. During long term storage the ambient temperature should not exceed $30^{\circ} \mathrm{C}$.
4. In isolated cases the properties of a Plumbicon may deteriorate slightly when it is kept idle for long periods such as may occur:

- between the factory's pre-shipment test and the actual delivery to the customer;
- between receipt of the tube and its installation;
- when the camera is not used for a long time.

Although the chances of such deterioration are remote it is advisible to operate the tube for some hours at intervals not more than 4 weeks apart.
The following procedure and conditions are recommended:

- Set grid no. 1 bias control to maximum negative bias (beam cut-off).
- Allow a heating-up time of the cathode of at least one minute before turning up the grid no. 1 bias control to produce a beam.
- Set scanning amplitudes to overscan condition.
- Apply an even illumination to the target to obtain a signal current of approx. $0.15 \mu \mathrm{~A}$ and adjust the beam current for correct stabilization.

5. The signal electrode connection is made by a springcontact, which is part of the focusing coil assembly, and is kept pressed against the signal electrode ring.
6. Electrostatic shielding of the signal electrode is required to avoid interference effects in the picture. Effective shielding is provided by a grounded shield inside the focusing coil at the faceplate end, and one inside the deflecting yoke.
7. The light transfer characteristic of the Plumbicon tube being characterized by a gamma near unity, it may be desirable for broadcast applications to incorporate a gamma correcting circuitry in the video-amplifier system with an adjustable gamma of 0.5 to 1 .

It is suggested to design this gamma correcting circuitry such that an extra compression can be introduced by manual control in the video signal range of $75 \%$ to $100 \%$ of normal peak white level.

This provision will prevent the video-amplifier system from becoming overloaded when the Plumbicon tube is exposed to scenes containing small peaked highlights as caused by reflections of shiny objects.
8. The Plumbicon tube not generating own noise to any noticeable extent, the signal-to--noise ratio will be determined mainly by the entrance noise of the video-amplifier system.

The high sensitivity of the Plumbicon tube warrants pictures with excellent signal-to--noise ratio under normal studio lighting conditions provided its output is fed into a well-designed input stage of the video-amplifier system. In such a system an aperture correction may be incorporated to ensure an attractive gain in resolving power without visually impairing the signal-to-noise ratio.

## INSTRUCTIONS FOR USE

Instructions for use are packed with each tube

## CAMERA TUBE

Plumbicon*, sensitive pick-up tube with lead oxide photoconductive target and low velocity stabilization. Provided with sepatate mesh construction.

The tubes of this series are mechanically and electrically identical to the tubes of the XQ1020 series, the only difference being the degree of freedom from blemishes of the photoconductive target.

The tubes are intended for industrial and educational black and white and colour cameras. The series comprises the following versions:

XQ1021 for black and white cameras
XQ1021R $\left.\begin{array}{l}\text { XQ1021G }\end{array}\right\} \quad$ for use in the chrominance channels of colour cameras XQ1021B

For all further information see data of the QX1020 series.
*Registered Trade Mark for T.V. camera tube.

## CAMERA TUBE

Plumbicon*, sensitive high definition pick-up tube with lead-oxide photoconductive target and low velocity stabilisation.
Provided with separate mesh construction.
The XQ1022 is exclusively intended for use with X-ray image intensifiers in medical equipment.

## NOTES

1. All underscanning of the specified useful target area of 18 mm diameter or failure of scanning should be avoided. Since this may cause permanent damage to the photoconductive layer.
2. The area beyond the 18 mm circular optical image preferably to be covered by a mask.
3. The near unity gamma of the XQ1022 ensures good contrast when televising low contrast X-ray image-intensifier pictures as encountered in radiology. Further contrast improvement may be obtained when an adjustable gamma expansion circuitry is incorporated in the video amplifier system.
4. For optimal screening of the target from the live end of the line deflection coils the use of AT1132/01 is recommended.
5. Cas which effectively is the output impedance, increases when the tube is inserted into the deflection/focusing coil assembly.
6. See "Accessories".
7. With no blanking voltage on $g_{1}$.
8. At $\mathrm{V}_{\mathrm{k}}=0 \mathrm{~V}$.
9. For short intervals. During storage the tube face shall be covered with the plas tic hood provided.
10. Grid No. 3 voltage adjusted for optimum picture focus.
11. Grid No. 4 voltage $50-100 \mathrm{~V}$ positive to grid No. 3 voltage.
12. The target voltage should be adjusted to the value indicated by the tube manufacturer on the test sheet as delivered with each individual tube.
13. Operation of the tube with beam currents $I_{b}$ not sufficient to stabilize the brightest picture elements must be carefully avoided by order to prevent loss of high light detail and/or "sticking" effects. The incorporation of a separate mesh construction allows excess beam currents Ib up to $0.6 \mu \mathrm{~A}$ to be applied without appreciable loss in resolution.
14. For AT1122, AT1132, AT1132/01, at $\mathrm{V}_{\mathrm{g}_{3}}=550$ to $600 \mathrm{~V}, \mathrm{~V}_{\mathrm{g}_{4}}=675 \mathrm{~V}$

| Focus current | 25 mA |  |
| :--- | ---: | :---: |
| Line deflection current | 250 mApp | for $18 \mathrm{~mm} \times 18 \mathrm{~mm}$ |
| Frame deflection current | 50 mApp |  |

The optimum voltage ratio $\mathrm{V}_{4} / \mathrm{Vg}_{3}$ depends on the type of focusing/deflection coil used: for types AT1112, AT1132, AT1132/01 ratio of $1.1: 1$ to $1.15: 1$ is recommended.
15. Substraction of the dark current is unnecessary because of the extremely small value.
16. In the case of a black/white camera the illumination on the photoconductive layer, $\mathrm{B}_{\mathrm{ph}}$, is related to scene illumination, $\mathrm{B}_{\mathrm{Sc}}$, by the formula:

$$
\mathrm{B}_{\mathrm{ph}}=\mathrm{B}_{\mathrm{Sc}} \frac{\text { R.T. }}{4 \mathrm{~F}^{2}(\mathrm{~m}+1)^{2}}
$$

in which $R$ represents the average scene reflectivity or the object reflectivity, whichever is relevant, $T$ the lens transmission factor, $F$ the lens aperture, and $m$ the linear magnification from scene to target.
17. With a signal current of $0.1 \mu \mathrm{~A}$ and a beam current of $0.5 \mu \mathrm{~A}$.
18. Horizontal amplitude response can be raised by the application of aperture correction. Such compensation, however, does not affect the vertical resolution, nor does it influence the limiting resolution.
19. The stated ratio represents the "visual equivalent signal-to-noise ratio", which is taken as the ratio of highlight video-signal current to R.M.S. noise current, multiplied by a factor of 3 . (Assuming an R.M.S. noise current of the video pre-amplifier of $2 \cdot 10^{-9} \mathrm{~A}$, bandwidth 5 MHz ).

## GENERAL RECOMMENDATIONS

1. During transport, handling and storage the axis of the Plumbicon must be either vertical, with faceplate up, or horizontal; the faceplate should be covered with the hood provided.
2. To avoid damage to the tungsten basepins, the Plumbicon should be inserted into its socket with care. Shocks, undue force, and bending loads on the pins are to be avoided.
3. During long term storage the ambient temperature should not exceed $30{ }^{\circ} \mathrm{C}$.
4. In isolated cases the properties of a Plumbicon may deteriorate slightly when it is kept idle for long periods such as may occur:
. between the factory's pre-shipment test and the actual delivery to the customer;
. between receipt of the tube and its installation;
. when the camera is not used for a long time.
Although the chances of such deterioration are remote it is advisable to operate the tube for some hours at intervals not more than 4 weeks apart.

The following procedure and conditions are recommended:
. Set grid no. 1 bias control to maximum negative bias (beam cut-off).
. Allow a heating-up time of the cathode of at least one minute before turning up the grid no. 1 bias control to produce a beam.
. Set scanning amplitudes to overscan condition.
. Apply an even illumination to the target to obtain a signal current of approx. $0.15 \mu \mathrm{~A}$ and adjust the beam for correct stabilization.
5. The signal electrode connection is made by a springcontact, which is part of the focusing coil assembly, and is kept pressed against the signal electrode ring.
6. Electrostatic shielding of the signal electrode is required to avoid interference effects in the picture. Effective shielding is provided by a grounded shield inside the focusing coil at the faceplate end, and one inside the deflecting yoke.

## INSTRUCTIONS FOR USE

Instructions for use are packed with each tube

## CAMERA TUBE

Plumbicon*, sensitive pick up tube, with lead-oxide photoconductive target with extended red response and high resolution.
Low velocity target stabilization. Provided with separate mesh construction for good uniformity of signal and resolution and good highlight handling.
The XQ1023 is intended for use in black and white cameras, the XQ1023L for use in the luminance channel of four tube colour cameras, the XQ1023R for use in the red channel of both three and four tube colour cameras.

## NOTES

1. a) Underscanning of the specified target area of $12.8 \times 17.1 \mathrm{~mm}^{2}$ or failure of scanning, should be avoided since this may cause damage to the photoconductive target.
b) In a colour camera the effective useful image dimensions will be slightly smaller, due to small displacements of the guns in the tube from the central position (in that case the centers of the optical images on the faceplates do not coincide exactly with the centers of the useful photoconductive surfaces). An effective useful image area of $12.6 \times 16.8 \mathrm{~mm}^{2}$ is guaranteed.
2. For proper orientation of the image on the photoconductive layer the horizontal scan direction should be parallel to the plane passing through the tube axis and the index pin.
3. All measurements are made with an infrared absorbing filter, Balzers, Calflex B1/K1 interposed between light source and target. For typical transmission curve of this filter see page 10 .
4. Measured with 4.54 lux on the specified target area, when the infrared absorbing filter is removed. The signal current obtained in $n \mathrm{~A}$ equals the sensitivity in $\mu \mathrm{A}$ per filtered lumen ( $\mu \mathrm{A} / \mathrm{LmF}$ ).
5. Measured as indicated in notes 3 and 4 but with additional filter inperposed between light source and target. Filter used is: Schott, OG2 ( 3 mm ). For trans mission curve see page 10 .
6. The use of gamma-stretching circuitry is recommended.
7. For optimal screening of target from live end of line deflection coils type AT1113/01 and type AT1132/01 are recommended.
8. Capacitance $\mathrm{C}_{\mathrm{a}_{5}}$ to all, which effectively is the output impedance, increases when the tube is inserted into the deflecting/focusing assembly.
9. For focusing/deflecting coil assembly, see under "Accessories".
$23)^{24}$ ) See page 7 .

## NOTES (continued)

10. With no blanking voltage on $\mathrm{g}_{1}$.
11. At $\mathrm{V}_{\mathrm{K}}=0 \mathrm{~V}$.
12. A minimum of 1 minute heating -up time for the heater is to be observed before drawing cathode current.
13. For short intervals. During storage and idle periods of the camera the tubeface shall be covered with the plastic hood provided, respectively the lens be capped.
14. The signal electrode voltage shall be adjusted to 45 V . To compete with exces sive highlights in the scene to be televised the signal electrode voltage may be reduced to a minimum of 25 V , this will however result in some reduction in performance.
15. Black and white coil assemblies

AT1132, AT1132/01
$\mathrm{V}_{\mathrm{g}_{3}}=600 \mathrm{~V}$
$\mathrm{~V}_{4}=650 \mathrm{~V}$ to 700 V

Colour assemblies
AT1112, AT1113, ATil13/01

$$
\begin{aligned}
& \mathrm{V}_{\mathrm{g}_{3}}=600 \mathrm{~V} \\
& \mathrm{~V}_{4}=650 \mathrm{~V} \text { to } 700 \mathrm{~V}
\end{aligned}
$$

| focus <br> current <br> mA | line <br> deflection <br> current <br> mApp | frame <br> deflection <br> current <br> mA $_{p p}$ |  |
| :---: | :---: | :---: | :---: |
|  | 25 | 235 | 35 |
| approx. | 100 | 235 | 35 |

The direction of the current through the focusing coil should be chosen such that a north seeking pole will be repelled at the faceplate end of the coil.
The optimum voltage difference between grid No. 4 and grid No. 3 is depending on the type of focusing/deflection assembly used. For above types a voltage difference of 50 V to 100 V is recommended.
16. To accomodate for peaked highlights (reflections etc.) in the scene to be televised some over-stabilization is recommended.
The figures quoted underneath for resolution relate to a "white" signal $\mathrm{I}_{\mathrm{S}}$ of $0.3 \mu \mathrm{~A}$ and a beam current Ibeam sufficient to just stabilize a peaked "white" signal of $0.6 \mu \mathrm{~A}$ for XQ1023 and XQ1023L, respectively $0.15 \mu \mathrm{~A}$ and $0.3 \mu \mathrm{~A}$ for XQ1023R .
17. Grid No. 3 voltage adjusted for correct electrical focus.
18. Faceplate illumination level for the XQ1023 and XQ1023L typically needed to produce $0.3 \mu \mathrm{~A}$ signal current will be approx. 3 lux. The signal current stated for the XQ1023R will be obtained with an incident light-level $\left(2854^{\circ} \mathrm{K}\right)$ on the filter of approx. 10 lux.
The figures stated for modulation depth are based on the use of the filter described in note 5 .

## NOTES (continued)

19. Illumination on the photo-conductive layer, $\mathrm{B}_{\mathrm{ph}}$, in the case of a black/white camera is related to scene-illumination, $\mathrm{B}_{\mathrm{SC}}$, by the formula:

$$
\mathrm{B}_{\mathrm{ph}}=\mathrm{B}_{\mathrm{Sc}} \frac{\mathrm{R} \cdot \mathrm{~T}}{4 \mathrm{~F}^{2}(\mathrm{~m}+1)^{2}}
$$

in which $R$ represents the scene-reflexivity (average or the object under consideration, whichever is relevant), $T$ the lens transmission factor, $F$ the lens aperture and $m$ the linear magnification from scene to target.
A similar formula may bederived for the illumination level on the photoconductive layer of the XQ1023L, XQ1023R tubes in which the effects of the various components of the complete optical system have been taken into account.
20. The figures shown represent the typical horizontal amplitude responses of the tubes proper after correction for losses in resolution introduced by the optical system.
Horizontal amplitude response can be raised by the application of suitable correction circuits. Such compensation, however, does not affect vertical resolution, nor does it influence the limiting resolution.
21. Corner resolution is measured on the diagonal, at a distance from the picture center equal to 0.35 times the picture diagonal.
22. After readjustment of the electrical focus. For optimal overall resolution the application of dynamic focusing voltages to grid No. 3 is recommended.
23. The stated radio represents the "visual equivalent signal-to-noise ratio", which is taken as the ratio of highlight video-signal current to R.M.S. noise-current, multiplied by a factor of 3 . (Assuming an R.M.S. noise-current of the video-pre-amplifier of $2 \cdot 10^{-9} \mathrm{~A}$, bandwidth 5 MHz ).
24. Measured with a signal current $I_{S}$ which has been flowing through the target at least 30 s and beam current sufficient to just stabilize a signal current of magnitude $\mathrm{Ib}_{\mathrm{b}}$. The figures in the columns 2 and 4 are indicative for the performance of the tubes under low-key conditions when overbeamed.

## GENERAL RECOMMENDATIONS AND INSTRUCTIONS FOR USE

## TRANSPORT, HANDLING, STORAGE

During transport, handling or storage the longitudinal axis must either be in a horizontal position or be kept vertically with the faceplate of the tube up.

During long-term storage the ambient temperature should preferably not exceed $30^{\circ} \mathrm{C}$.

## GENERAL

1. Signal-electrode connection is made by a suitable spring-contact, executed as part of the focusing coil assembly, against the signal electrode ring at the faceend of the tube.
2. Electrostatic shielding of the signal-electrode is required in order to avoid interference effects in the picture. Effective shielding is provided by grounding shields on the inside of the face-end of the focusing coil and on the inside of the deflecting yoke.
3. In isolated cases the properties of a Plumbicon may deteriorate slightly when it is kept idle for long periods such as may occur:
. between the factory's pre-shipment test and the actual delivery to the customer;

- between receipt of the tube and its installation;
. when the camera is not used for a long time.
Although the chances of such deterioration are remote it is advisable to operate the tube for some hours at intervals not more than 4 weeks apart.

The following procedure and conditions are recommended:
. Set grid no. 1 bias control to maximum negative bias (beam cut-off).

- Allow a heating-up time of the cathode of at least one minute before turning up the grid no. 1 bias control to produce a beam.
. Set scanning amplitudes to overscan condition.
. Apply an even illumination to the target to obtain a signal current of approx. $0.15 \mu \mathrm{~A}$ and adjust the beam for correct stabilization.

4. The Plumbicon as described in these data has been provided with tungsten base pins. It is recommended to avoid mechanical force and shocks to these pins and to insert the tube into its socket, type 56021, with care.
5. The light-transfer characteristic of the Plumbicon being characterised by a gamma near unity, it may be desirable for broadcast applications to incorporate a gamma correcting circuitry in the video-amplifier system with an adjustable gamma of 0.5 to 1 .
It is suggested to design this gamma correcting circuitry such that an extracompression can be introduced by manual control in the video signal range of 75 to $100 \%$ of normal peak white level.
This provision will prevent the video amplifier system from becoming overloaded when the Plumbicon with its near unity gamma is exposed to scenes containing small peaked highlights as caused by reflections of shiny objects.
6. The Plumbicon not generating own noise to any noticeable extent, the signal-tonoise ratio will mainly be determined by the entrance noise of the video amplifier system.
The high sensitivity of the Plumbicon warrants pictures with excellent signal-tonoise ratio under normal studio lighting conditions provided its output is fed into a well-designed input stage of the video amplifier system. In such a system an aperture correction may be incorporated to ensure an attractive gain in resolving power without impairing the signal-to-noise ratio.

## INSTRUCTIONS FOR USE

Instructions for use are packed with each tube.

Spectral sensitivity characteristic measured at a constant signal output of 50 nA from $12.8 \times 17 \mathrm{~mm}^{2}$ (except at low sensitivity values).

Typical transmission curve of heat-reflecting interference filter, Type CALFLEX-B1/K1

## CAMERA TUBE

Plumbicon ${ }^{*}$, sensitive pick-up tube with lead-oxide photoconductive target with extended red response and high resolution. Low velocity target stabilization. Provided with separate mesh construction.
The tubes of this series are mechanically and electrically identical to the tuhes of the XQ1023 series, the only difference being the degree of freedom from blemishes of the photoconductive target.

The tubes are intended for industrial and educational black and white and colour cameras. The series comprises the following versions:

| XQ1024 | for black and white cameras |
| :--- | :--- |
| XQ1024R | for use in the red channel of colour cameras |

For all further information see data of XQ1023.

* Registered Trade Mark for T.V. camera tube.

## CAMERA TUBE

Plumbicon*, sensitive pick-up tube with lead-oxide photoconductive target with extended red response and high resolution.

Low velocity target stabilization. Provided with separate mesh for good uniformity of signal and resolution and good highlight handling.

The tubes of the XQ1025 series are identical to the tubes of the XQ1023 series but incorporate an infra-red reflecting filter on the anti-halation glass disc.

| QUICK REFERENCE DATA |  |  |  |
| :--- | :--- | :--- | :---: |
| Focusing : magnetic | Heater: | $6.3 \mathrm{~V}, 300 \mathrm{~mA}$ |  |
| Deflection: magnetic | Cut-off of |  |  |
| Diameter: approx. 30 mm | spectral response: $\sim 750 \mathrm{~nm}$ | 1) |  |
| Provided with anti-halation glass disc with infra-red reflecting filter. |  |  |  |

The infra-red reflecting filter eliminates ${ }^{2}$ ) the need for additional filters in the colour splitting systems when the XQ1025L and XQ1025R are applied in colour cameras originally designed for tubes of the XQ1020 series.

The manufacturer selects the filters per individual tube such, that the spreads in spectral responses in the long wavelength region as published for the XQ1023 tubes (See data XQ1023, Febr. 1909, page 10) are greatly reduced, warranting minimum differences in colour rendition between colour cameras of identical manufacture.

The XQ1025 will provide black and white pictures with true tonal rendition of colours, the spectral response approaching very nearly the relative spectral sensitivity of the human eye.

The XQ1025L is intended for use in the luminance channel of four tube colour cameras, the XQ 1025 R for use in the red channel of both three and four tube colour cameras.

[^23]
## OPTICAL

Spectral response
see below
Max. response at approx. 500 nm

Cut-off
~ 750 nm l )

Filter: Hard coating on anti-halation glass disc. Care in handling to avoid scratches is strongly recommended.

For all further data revert to the Published Data of the tubes of the XQ1023 series, Febr. 1969 issue. Note 3, page 5 of these data, referring to the Balzers B1/K1 filter, does not apply.

1) Defined as the wavelength at which the spectral response has dropped to $\leq 1 \%$ of the peak response ( $\sim 500 \mathrm{~nm}$ ).
${ }^{2}$ ) An infra-red absorbing filter for wavelengths in excess of 900 nm is assumed to be incorporated in the optical system of the camera.

## CAMERA TUBE

Plumbicon*, sensitive pick-up tube with lead-oxide photoconductive target with extended red response and high resolution. Low velocity target stabilization.

Provided with separate mesh construction and anti-halation glass disc with I.R. filter.
The tubes of this series are mechanically and electrically identical to the tubes of the XQ1025 series, the only difference being found in the degree of freedom from blemishes of the photoconductive target.

The tubes are intended for industrial and educational black and white and colour cameras. The series comprises the following versions:

$$
\begin{array}{ll}
\text { XQ1026 } & \text { for black and white cameras } \\
\text { XQ1026R } & \text { for use in the red channel of colour cameras }
\end{array}
$$

For all further information see data of the XQ1025 series.

* Registered Trade Mark for T.V. camera tube.

## CAMERA TUBE

Vidicon television camera tube with low heater consumption, integral mesh construction, magnetic focusing, magnetic deflection, short length ( $130 \mathrm{~mm}, 5 \mathrm{in}$ ), and 25.4 mm ( 1 in ) diameter.

|  | QUICK REFERENCE DATA |
| :--- | :--- |
| Integral mesh |  |
| Focusing | magnetic |
| Deflection | magnetic |
| Diameter | $25.4 \mathrm{~mm}(1 \mathrm{in})$ |
| Length | $130 \mathrm{~mm} \mathrm{(5in)}$ |
| Heater | $6.3 \mathrm{~V}, 95 \mathrm{~mA}$ |
| Resolution | $\geq 600 \mathrm{TV}$ lines |

The electrical and mechanical properties of the two types are essentially identical, the main difference being found in the degree of freedom from blemishes of the photoconductive layers.

XQ1031 - intended for use in industrial and broadcast applications in which a high standard of performance is required.
XQ1032 - general purpose tube for less critical industrial applications, experiments, amateur use etc.

## OPTICAL

Diagonal of quality rectangle on photoconductive layer (aspect ratio 3:4)
max.
16
mm

Orientation of image on photoconductive layer:
The direction of the horizontal scan should be essentially parallel to the plane defined by the short index pin and the longitudinal axis of the tube, unless rotation of the tube is found necessary to minimize the number of blemishes in the picture.

Photoconductive layer
Spectral response, max. response at
type A
approx. 550 nm

## HEATING

Indirect by A.C. or D.C.; parallel and series supply
Heater voltage $\mathrm{V}_{\mathrm{f}}$

| $\mathrm{V}_{\mathrm{f}}$ | 6.3 | $\mathrm{~V} \pm 10 \%$ |
| :---: | :---: | :---: |
| $\mathrm{I}_{\mathrm{f}}$ | 95 | mA |

When the tube is used in a series heater chain, the heater voltage must not exceed 9.5 $\mathrm{V}_{\mathrm{rms}}$ when the supply is switched on.

Data based on pre-production tubes.

## CAPACITANCES

Signal electrode to all
$\mathrm{C}_{\text {as }} \quad 4.5 \mathrm{pF}$
This capacitance, which effectively is the output impedance of the tube, increases when the tube is inserted into the deflection and focusing coil unit.

## MECHANICAL DATA

Dimensions in mm
Base: JEDEC no. E8-11, IEC 67-I-33a

Mounting position: any
Net weight

## ACCESSORIES

Socket
Deflection and focusing coil unit

approx.
50

## DEFLECTION magnetic

FOCUSSING magnetic

LIMITING VALUES (Absolute max. rating system)
for scanned area of $9.6 \mathrm{~mm} \times 12.8 \mathrm{~mm}(3 / 8 \mathrm{in} \times 1 / 2 \mathrm{in})$
"Full-size scanning", i.e. scanning of a $9.6 \mathrm{~mm} \times 12.8 \mathrm{~mm}$ area of the photoconductive layer should always be applied. Underscanning, i.e. scanning of an area less than $9.6 \mathrm{~mm} \times 12.8 \mathrm{~mm}$, may cause permanent damage to the specified full-size area.

Signal-electrode voltage
Grid no. 4 voltage and grid no. 3 voltage
Grid no. 2 voltage
Grid no. 1 voltage, negative
positive
Cathode-to-heater voltage, peak positive

Dark current, peak
Output current, peak
Faceplate illumination
Faceplate temperature, storage and operation

| $\mathrm{V}_{\text {as }}$ | max. | 100 | V |
| :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\mathrm{g} 4, \mathrm{~g} 3}$ | max. | 800 | V |
| $\mathrm{V}_{\mathrm{g} 2}$ | max. | 450 | V |
| $-\mathrm{V}_{\mathrm{g} 1}$ | max. | 125 | V |
| $\mathrm{V}_{\mathrm{g} 1}$ | max. | 0 | V |
| $\mathrm{V}_{\mathrm{kf}} \mathrm{p}$ | max. | 125 | V |
| $-\mathrm{V}_{\mathrm{kf}}{ }_{\mathrm{p}}$ | max. | 10 | V |
| $\mathrm{I}_{\text {dark }}$ | max. | 0.25 | $\mu \mathrm{A}$ |
| $\mathrm{I}_{\mathrm{as}}{ }_{\mathrm{p}}$ | $\max$. | 0.6 | $\mu \mathrm{A}^{1!}$ |
| E | max. | 5000 | 1 x |

1) Video amplifiers should be capable of handling signal-electrode currents of this magnitude without overloading the amplifier or distorting the picture.
2) Under difficult environmental conditions a flow of cooling air directed at the faceplate is recommended. When televising flames and furnaces appropriate infrared absorbing filters should be used.

## OPERATING CONDITIONS AND PERFORMANCE

for a scanned area of $9.6 \mathrm{~mm} \times 12.8 \mathrm{~mm}$ and a faceplate temperature of $30 \pm 2^{\circ} \mathrm{C}$

## CONDITIONS

## NOTES

1) Beam focus is obtained by the combined effect of grid no. 3, the voltage of which should be adjustable over the indicated range, and a focus coil having a field strength of $3200 \mathrm{~A} / \mathrm{m}$ ( 40 Oe ).
2) The polarity of the focusing coil should be such that a north-seeking pole is attracted to the image end of the focusing coil, with this pole located outside of and at the image end of the focusing coil.
3) The alignment coil unit should be positioned on the tube so that its centre is at a distance of approx. $94 \mathrm{~mm}(311 / 16 \mathrm{in}$ ) from the face of the tube and that its axis coincides with the axis of the tube, the deflecting yoke and ti "ocusing coil.
4) The deflection circuits must provide sufficiently linear scanning for good blacklevel reproduction. The output current being proportional to the velocity of scanning, any change in this velocity will produce non-uniformity.
5) Signal current is defined as the component of the output current after the dark current has been subtracted.
6) Square-wave response. Measured with a video amplifier system having an appropriate bandwidth. 8 lux on specified target area, target voltage adjusted for a dark current of 20 nA , beam set for correct stabilization.
7) Conditions:

The camera focused on a uniformly illuminated two-zone test pattern, the diameter of the centre zone (1) being equal to the raster height. Zone (2) being defined as the remainder of the scanned area. Signal electrode voltage adjusted for a dark current of 20 nA , illumination on target 8 lx (c.t. $=2854 \mathrm{~K}$ ).

Scanning amplitudes of the monitor adjusted to obtain a raster with an aspect ratio of $3: 4$.
Monitor set-up and contrast control adjusted for faint raster when lens of camera is capped, and for non-blooming bright raster when lens of camera is uncapped.

Under the above conditions the number and size of the spots visible in the monitor picture will not exceed the limits stated below. Both black and white spots must be counted, unless the amplitude is less than $50 \%$ of the peak white signal.

XQ1031

| Spot size <br> in \% of raster height | Maximum number of spots <br> zone 1 |  |
| :---: | :---: | :---: |
| $>1$ | none | zone 2 |
| 1 to 0.6 | none | none |
| 0.6 to 0.2 | 1 | 2 |
| $\leqslant 0.2$ | $*$ | $*$ |

XQ1032

| Spot size in <br> $\%$ of raster height | Maximum number of spots |  |
| :---: | :---: | :---: |
| zone 1 |  |  |$\quad$ zone 2

* Do not count spots of this size unless concentration causes a smudgy appearance.
a) Minimum separation between any 2 spots greater than $0.3 \%$ of raster height is limited to a distance equivalent to $4 \%$ of raster height.
b) Tubes are rejected for smudge, lines, streaks, mottled, grainy, or uneven background having contrast ratios greater than 1.5 to 1 .

## CAMERA TUBE

Vidicon television camera tube with low heater consumption, separate mesh construction, magnetic focusing, magnetic deflection and 25.4 mm ( 1 in ) diameter intended for use in medical and industrial X-ray equipment in combination with an X-ray image intensifier tube.

| QUICK REFERENCE DATA |  |
| :--- | :--- |
| Separate mesh |  |
| Focusing | magnetic |
| Deflection | magnetic |
| Diameter | $25.4 \mathrm{~mm}(1 \mathrm{in})$ |
| Length | $158 \mathrm{~mm}\left(6 \frac{1}{4} \mathrm{in}\right)$ |
| Provided with particle trap | $6.3 \mathrm{~V}, 95 \mathrm{~mA}$ |
| Heater | $\geq 1000 \mathrm{TV}$ lines |
| Resolution |  |

The electrical and mechanical properties of the XQ1041 are essentially identical to those of the other tubes of the XQ1040 series, the main differences being found in the degree of freedom from blemishes of the photoconductive layer and from mesh deficiencies.

## OPTICAL

Quality area on photoconductive layer circular area diam. max. 15 mm Direction of scan.
The direction of the horizontal scan should be essentially parallel to the plane defined by the short index pin and the tube axis.

Spectral response, max. response at approx. 550 mm

## HEATING

Indirect by A.C. or D.C.; parallel and series supply

| Heater voltage | $\mathrm{V}_{\mathrm{f}}$ | 6.3 | $\mathrm{~V} \pm 10 \%$ |
| :--- | :--- | ---: | :--- |

|  | 50 | 65 | \% ${ }^{9}$ ) |

## NOTES to page 4.

1) The optimal grid no. 4 voltage for maximum resolution and optimal uniformity of black and white level depends on the type of coil unit used and will be within the range 1.2 to 1.5 times $\mathrm{V}_{3}$.
Under no circumstances should grid no. 4 (mesh) be allowed to operate at a voltage level below the $\mathrm{V}_{3}$ level as needed for beam focus, since this may damage the target.
${ }^{2}$ ) Because of the higher deflecting and focusing power required to produce adequate field strength the tube temperature will increase and adequate provisions for cooling should be made.
${ }^{3}$ ) The polarity of the focusing coil should be such that a north-seeking pole is attracted to the image end of the focusing coil, with this pole located outside of and at the image end of the focusing coil.
2) The alignment coil unit should be positioned on the tube so that its centre is at a distance of approx. 94 mm ( $311 / 16 \mathrm{in}$ ) from the face of the tube and that its axis coincides with the axis of the tube, the deflecting yoke and the focusing coil.
3) Corresponds to 20 nA for $9.6 \mathrm{~mm} \times 12.8 \mathrm{~mm}$ beam.
${ }^{6}$ ) Signal electrode voltage adjusted for a dark current of 35 nA .
${ }^{7}$ ) Signal current is defined as the component of the output current after the dark current has been subtracted.
${ }^{8}$ ) Measured with a video amplifier system having an appropriate bandwidth.
${ }^{9}$ ) Square wave response. Typical values for the tube proper, after correction for faults introduced by the optical system, measured under conditions of a peak signal current $\mathrm{I}_{\mathrm{S}_{\mathrm{p}}}=0.15 \mu \mathrm{~A}$ and a beam current sufficient to stabilize a signal current of $0.5 \mu \mathrm{~A}$.

## CAMERA TUBE

Plumbicon* television camera tube with high resolution lead-oxide photoconductive target, low heater power, separate mesh construction, magnetic focusing, magnetic deflection and 25.4 mm ( 1 in ) diameter.
The tubes of the XQ1070 and XQ1070/01 series produce the same resolving power as the 30 mm diameter tubes like the XQ1020. They are mechanically interchangeable with 1 in diameter vidicons with separate mesh, and have the same pin connections. The XQ1070 and XQ1070/01 are intended for use in black-and-white cameras, the XQ1070L, R, G, B and XQ1070/01L, R, G, B in colour cameras in broadcast, educational and high quality industrial applications.

| QUICK REFERENCE DATA |  |
| :--- | :--- |
| Separate mesh |  |
| Focusing | magnetic |
| Deflection | magnetic |
| Diameter | $25.4 \mathrm{~mm}(1 \mathrm{in})$ |
| Length | $158 \mathrm{~mm}(6.25 \mathrm{in})$ |
| Provided with anti -halation glass disc: | XQ1070L, R, G, B |
| Without anti -halation glass disc: | XQ1070/01L, R, G, B |
| Heater | $6.3 \mathrm{~V}, 95 \mathrm{~mA}$ |
| Resolution | $\geq 750 \mathrm{~T} . \mathrm{V}$. lines |

## OPTICAL

Quality rectangle on photoconductive target
(aspect ratio $3: 4$ )
Orientation of image on photoconductive target
For correct orientation of the image on the target the horizontal scan should be essentially parallel to the plane passing through the tube axis and the short index pin.

## Faceplate

Refractive index
n 1.49
Refractive index of anti-halation glass disc
n 1.52

[^24]
## ELECTRICAL

Heating: Indirect by A.C. or D. C.; parallel or series supply

| Heater voltage | $\mathrm{Vf}_{\mathrm{f}}$ | 6.3 | $\mathrm{~V} \pm 5 \%$ |
| :--- | :--- | ---: | :---: |
| Heater current | If | 95 | mA |

When the tube is used in a series heater chain, the heater voltage must not exceed 9.5 $\mathrm{V}_{\mathrm{rms}}$ when the supply is switched on.

To avoid registration errors in colour cameras, stabilization of the heater voltage is recommended.

Electron gun characteristics
Cut-off
Grid no. 1 voltage for cut-off at $\mathrm{Vg}_{2}=300 \mathrm{~V} \quad \mathrm{Vg}_{1} \quad-35$ to -100 V

## NOTES

1) Underscanning of the specified useful area of $12.8 \mathrm{~mm} \times 9.6 \mathrm{~mm}$, or failure of scanning, should be avoided since this may cause damage to the photoconductive layer.
2) For focusing/deflection coil unit see under "Accessories".
3) Plumbicon tubes do not permit automatic sensitivity control by means of regulation of the signal electrode voltage. Adequate control is therefore to be achieved by other means (iris control and neutral density filters).
If the tube is applied in cameras originally designed for vidicon tubes, the automatic sensitivity control circuitry should be made inoperative and the signal electrode voltage set to the value indicated in note ${ }^{5}$ ).
${ }^{4}$ ) For short intervals. During storage the tube face shall be covered with the plastic hood provided; when the camera is idle the lens shall be capped.
4) The signal electrode voltage shall be adjusted to 45 V . To enable the tube to han dle excessive highlights in the scene to be televised the signal electrode voltage may be reduced to a minimum of 25 V , this will, however, result in some reduction in performance.
5) The beam current $I_{b}$, as obtained by adjusting the control grid (grid no. 1) voltage is set to 200 nA for R and B tubes, 400 nA for $\mathrm{bl} / \mathrm{wh}, \mathrm{L}$ and G tubes.

Ib is not the actual current available in the scanning beam, but is defined as the maximum amount of signal current, $\mathrm{I}_{\mathrm{S}}$, that can be obtained with this beam.

In the performance figures, e.g.for resolution and lag, the signal current and beam current conditions are given, e.g. as $\cdot I_{S} / I_{b}=20 / 200 \mathrm{nA}$. This hence means: with a signal current of 20 nA and a beam setting which just allows a signal current of 200 nA .
N. B. The signal currents are measured with an integrating instrument connected in the signal electrode lead and a uniform illumination on the scannedarea. The peak signal currents as measured on a wave-form osciloscope will be a factor $\alpha$ larger.
$\left(\alpha=\frac{100}{100-\beta}, \beta\right.$ being the total blanking time in $\%$, for the CCIR system $\alpha a-$ mounts to 1.33)

|  |  | Focusing current* (mA) |  | $\begin{aligned} & \text { Line current } \\ & \text { (mApp) } \end{aligned}$ |  | Frame current ( $\mathrm{mA}_{\mathrm{pp}}$ ) |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Coil units | $\mathrm{Vg}_{4} / \mathrm{V}_{\mathrm{g} 3}$ | 600/375 | 960/600 | 600/375 | 960/600 | 600/375 | 960/600 |
| AT1102/01 |  | 18 | 23 | 200 | 250 | 27 | 34 |
| AT1103 |  | 20 | 26 | 200 | 250 | 29 | 38 |
| AT1116 |  | 83 | 105 | 260 | 330 | 38 | 48 |
|  |  | Approx. values for scanned area of $9.6 \times 12.8 \mathrm{~mm}^{2}$ |  |  |  |  |  |

*Adjusted for correct electrical focus. The direction of the focusing current shall be such that a north-seeking pole is attracted towards the image end of the focusing coil.
Line and frame alignment coil currents max. 21 mA (AT1103) resp. 15 mA (AT1116) corresponding to a flux density of approx. $4 \times 10^{-4}$ T (4 Gs).
${ }^{8)}$ ) In the case of a black/white camera the illumination on the photoconductive layer, $\mathrm{B}_{\mathrm{ph}}$, is related to scene illumination, $\mathrm{B}_{\mathrm{Sc}}$, by the formula:

$$
\mathrm{B}_{\mathrm{ph}}=\mathrm{B}_{\mathrm{SC}} \frac{\text { R.T. }}{4 \mathrm{~F}^{2}(\mathrm{~m}+1)^{2}}
$$

in which $R$ represents the average scene reflectivity or the object reflectivity, whichever is relevant, $T$ the lens transmission factor, $F$ the lens aperture, and m the linear magnification from scene to target.
A similar formula may be derived for the illumination level on the photoconductive layers of the R, G, and B tubes in which the effects of the various components of the complete optical system have been taken into account.
9) The optimum voltage ratio $\mathrm{Vg}_{4} / \mathrm{V}_{\mathrm{g}_{3}}$ to obtain minimum beam landing errors (preferably $\leq 1 \mathrm{~V}$ ) depends on the type of coil unit used. For types AT1102/01/ AT1103 and AT1116 a ratio of $1.5: 1$ to $1.6: 1$ is recommended.
10) Measuring conditions:

Illumination 4 lx (luminous flux $=0.5 \mathrm{mlm}$ ) from a tungsten light source with a c.t. of 2854 K , the appropriate filter inserted in the light path.

Filters used:

| XQ1070R, XQ1070/01R | Schott | OG570 | thickness | 3 mm |
| :--- | :--- | :--- | :--- | :--- |
| XQ1070G, XQ1070/01G | Schott | VG9 | thickness | 1 mm |
| XQ1070B, XQ1070/01B | Schott | BG12 | thickness | 3 mm |

For transmission curves see page 13 .
11) Gamma-stretching circuitry is recommended.
12) Typical faceplate illumination level for the XQ1070 and XQ1070/01 to produce $0.2 \mu \mathrm{~A}$ signal current will be approx. 4 lx . The signal currents stated for the colour tubes R, G, B will be obtained with an incident white light level (c.t. = 2854 K ) on the filter of approx. 10 lx . These figures are based on the filters described in note ${ }^{10}$ ). For filter BG12, however, a thickness of 1 mm is chosen.
13) The horizontal amplitude response can be raised by the application of suitable correction circuits, which affect neither the vertical resolution nor the limiting resolution.
14) After 10 s of complete darkness. The figures given represent typical percentages of the ultimate signal current obtained 60 ms respectively 200 ms after the illumination has been applied.
15) After a minimum of 5 s of illumination on the target. The figures given represent typical residual signals in percents of the original signal current 60 ms respectively 200 ms after the illumination has been removed.

## GENERAL AND RECOMMENDATIONS

1. During transport, handling and storage the axis of the Plumbicon must be either vertical, with faceplate up, or horizontal; the faceplate should be covered with the hood provided.
2. This series of Plumbicon tubes is provided with Kovar pins and therefore requires no more care in handling than vidicon tubes.
3. During long term storage the ambient temperature should not exceed $30^{\circ} \mathrm{C}$.
4. In isolated cases the properties of a Plumbicon may deteriorate slightly when it is kept idle for long periods such as may occur:

- between the factory's pre-shipment test and the actual delivery to the customer;
- between receipt of the tube and its installation;
- when the camera is not used for a long time.

Although the chances of such deterioration are remote it is advisible to operate the tube for some hours at intervals not more than 4 weeks apart.

The following procedure and conditions are recommended:

- Set grid no. 1 bias control to maximum negative bias (beam cut -off).
- Allow a heating -up time of the cathode of at least one minute before turning up the grid no. 1 bias control to produce a beam.
- Set scanning amplitudes to overscan condition.
- Apply an even illumination to the target to obtain a signal current of approx. $0.15 \mu \mathrm{~A}$ and adjust the beam current for correct stabilization.

5. The signal electrode connection is made by a spring contact, which is part of the focusing coil assembly, and is kept pressed against the signal electrode ring.
6. Electrostatic shielding of the signal electrode is required to avoid interference effects in the picture. Effective shielding is provided by one grounded shield inside the focusing coil at the faceplate end, and one inside the deflecting yoke.
7. The light transfer characteristic of the Plumbicon tube having a gamma near unity, it may be desirable to incorporate a gamma correcting circuitry in the video-amplifier system with an adjustable gamma of 0.5 of 1 .

The Plumbicon tube not generating noise to any noticeable extent, the signal-tonoise ratio will be determined mainly by the input noise of the video-amplifier system.
The high sensitivity of the Plumbicon tube warrants pictures with excellent sig-nal-to-noise ratio under normal lighting conditions provided its output is fed into a well-designed input stage of the video-amplifier system. In such a system an aperture correction may be incorporated to ensure an attractive gain in resolving power without visually impairing the signal to noise ratio.

## INSTRUCTIONS FOR USE

Instructions for use are packed with each tube.

Typical spectral response curve

Typical square-wave modulation transfer characteristics

Transmission of filters BG12, VG9 and OG570. See note 10

## CAMERA TUBE

Plumbicon*, television camera tube with high resolution lead-oxide photoconductive target, low heater power, separate mesh construction, magnetic focusing, magnetic deflection and 25.4 mm ( 1 in ) diameter.

The tubes of these series are mechanically and electrically identical to the tubes of the XQ1070 and XQ1070/01 series, the only difference being the degree of freedom from blemishes of the photoconductive target.

The tubes are intended for industrial and educational black-and-white and colour cameras. The series comprise the following versions:

| with anti-halation <br> glass disc | without anti-halation <br> glass disc |  |
| :--- | :--- | :--- |
| XQ1071 | XQ1071/01 | for bl/wh cameras |
| XQ1071R | XQ1071/01R | for use in the chrominance |
| XQ1071G | XQ1071/01G | $\left\{\begin{array}{l}\text { channels of } \\ \text { XQ1071B }\end{array}\right.$ |
| XQ1071/01B cameras |  |  |

For all further information see data of the XQ1070/XQ1070/01 series.

* Registered Trade Mark for television camera tube.

## CAMERA TUBE

Plumbicon* television camera tube with high resolution lead-oxide photoconductive target, low power heater, separate mesh construction, magnetic focusing, magnetic deflection, and 25.4 mm ( 1 in ) diameter.

The XQ1072 produces the same resolving power as the 30 mm diameter tube type XQ1022 and is exclusively intended for use with an X-ray intensifier in medical equipment.

The XQ1072 is mechanically interchangeable with 1 in diameter vidicons with separate mesh construction and has the same pin connections.

| QUICK REFERENCE DATA |  |

## NOTES

1) Underscanning of the specified useful target area of $15.0 \mathrm{~mm} \phi$ or failure of scanning should be avoided since this may cause damage to the photoconductive layer. The area beyond the $15.0 \mathrm{~mm} \phi$ area preferably to be covered by a mask.
2) For focusing/deflection coil unit see under "Accessories".
3) Plumbicon tubes do not permit automatic sensitivity control by means of regulation of the signal electrode voltage.
If the tube is applied in cameras originally designed for vidicon tubes, the automatic sensitivity control circuitry should be made inoperative and the signal electrode voltage set to the value indicated in note 8 .
4) For short intervals. During storage the tube face shall be covered with the plastic hood provided.
5) Scanning amplitude controls adjusted such that the $15 \mathrm{~mm} \phi$ quality area of the target is displayed on a standard monitor as a circular area with a diameter equal to the raster height.

6a) Grid no. 1 (control grid) voltage adjusted to produce a beam current, $\mathrm{I}_{\mathrm{b}_{\mathrm{p}}}$, which will allow a maximum peak signal current $I_{S p}$ of 500 nA .
N. B. The peak signal currents are measured on a waveform oscilloscope and with a uniform illumination on the $15 \mathrm{~mm} \phi$ target area. When measured with an integrating instrument connected in the signal-electrode lead the average signal currents will be smaller
a) by a factor $\alpha\left(\alpha=\frac{100-\beta}{100}\right), \beta$ being the total blanking time in $\%$; for the CCIR system $\alpha$ amounts to 0.75 .
b) by a factor $\delta, \delta$ being the ratio of the active target area (circle with $15 \mathrm{~mm} \phi$ ) to the area which would correspond with the adjusted scanning amplitudes ( $15 \times 20 \mathrm{~mm}^{2}$ ), see note 5 , this ratio amounts to $\delta=0.59$. The total ratio of integrated signal current, $\mathrm{I}_{\mathrm{S}}$, to the peak signal current, $\mathrm{I}_{\mathrm{Sp}}$, amounts to $\alpha \times \delta=0.44$.
${ }^{6 b}$ ) The peak signal currents stated relate to a target sensitivity to light with P20 distribution of $\min .200 \mu \mathrm{~A} / 1 \mathrm{~m}$, typical $275 \mu \mathrm{~A} / 1 \mathrm{~m}$.
${ }^{7}$ ) The optimum voltage ratio $\mathrm{V}_{\mathrm{g}} / / \mathrm{V}_{\mathrm{g} 3}$ to obtain minimum beam landing errors (preferably $\leq 1 \mathrm{~V}$ ) depends on the type of coil unit used. For types AT1102/01, AT1103, AT1116 a ratio of $1.5: 1$ to $1.6: 1$ is recommended.
${ }^{\text {8 }}$ ) Target voltage, $V_{\text {as }}$, adjusted to the value indicated by the tube manufacturer on the test sheet as delivered with each tube.

*Adjusted for correct electrical focus. The direction of the focusing current shall be such that a north-seeking pole is attracted towards the image end of the focusing coil.
Line and frame alignment coil currents max. 21 mA (AT1103) resp. 15 mA (AT1116) corresponding to a flux density of approx. $4 \times 10^{-4} \mathrm{~T}(4 \mathrm{Gs})$.
10) The near unity gamma of the XQ1072 ensures good contrast when televising low contrast X-ray image-intensifier pictures as encountered in radiology. Further contrast improvement may be obtained when an adjustable gamma expansion circuitry is incorporated in the video amplifier system.

11a) Measured with a transparency with a square wave test pattern with vertical bars. The figures given relate to a low frequency reference obtained from a square wave pattern of $1.0 \mathrm{lp} / \mathrm{mm}(385 \mathrm{kHz})$.
The aperture of the lens system adjusted for f 5.6
11b) As in 1la). Bandwidth of the video amplifier system and the waveform oscilloscope 15 MHz ( -3 dB point).
12) After a minimum of 5 s of illumination on the target. The figures given represent the residual signals in \% of the original signal current 60 ms respectively 200 ms after the illumination has been removed.

## GENERAL AND RECOMMENDATIONS

1. During transport, handling and storage the axis of the Plumbicon must be either vertical, with faceplate up, or horizontal; the faceplate should be covered with the hood provided.
2. This series of Plumbicon tubes is provided with Kovar pins and therefore requires no more care in handling than vidicon tubes.
3. During long term storage the ambient temperature should not exceed $30^{\circ} \mathrm{C}$.
4. In isolated cases the properties of a Plumbicon may deteriorate slightly when it is kept idle for long periods such as may occur:

- between the factory's pre-shipment test and the actual delivery to the customer.
- between receipt of the tube and its installation.
- if the camera is not used for a long time.

Although the chances of such deterioration are remote it is advisable to operate the tube for some hours at intervals not more than 4 weeks apart.

The following procedure and conditions are recommended:

- Set grid no. 1 bias -control to maximum negative bias (beam cut-off).
- Allow a heating -up time of the cathode of at least one minute before turning up the grid no. 1 bias -control to produce a beam.
- Set scanning amplitudes to overscan condition.
- Apply an even illumination to the target to obtain a signal current of approx. $0.15 \mu \mathrm{~A}$ and adjust the beam for correct stabilization.

5. The signal electrode connection is made by a spring contact, which is part of the focusing coil assembly, and is kept pressed against the signal electrode ring.
6. Electrostatic shielding of the signal electrode is required to avoid interference effects in the picture. Effective shieldingis provided by one grounded shield inside the focusing coil at the faceplate end, and one inside the deflecting yoke.

## INSTRUCTIONS FOR USE

Instructions for use are packed with each tube.

Modulation transfer characteristic

## CAMERA TUBE

Plumbicon *, 25.4 mm ( 1 in ) diameter television camera tube with high resolution lead-oxide photoconductive target, magnetic deflection, magnetic focus. The tubes of the XQ1080 series are provided with a separate mesh and a 0.6 W heater and fea ture:
. Anti-Comet-Tail electron gun for highlight handling.

- Extremely low lag.
. Lightpipe, for adjustable bias lighting to minimise lag under low-key conditions.
. Same resolving power as the 30 mm tubes such as the XQ1020.
- Ceramic centring ring for precise optical alignment.
. Electrode system with precision construction.
. Low output capacitance for optimal S/N ratio.
The tubes of the XQ1080 series are rear-loading tubes, i.e. to be inserted at the rear end of a special coil unit and they have slightly different dimensions and pin connections from other 1 in diameter Plumbicon tubes like e. g. XQ1070.
The XQ1080 is intended for use in black and white cameras XQ1080L, R, G and B are intended for use in colour cameras in broadcast, educational and high quality indus trial applications in which high contrast ratios may occur.

## NOTES

1) Underscanning of the specified useful area of $12.8 \mathrm{~mm} \times 9.6 \mathrm{~mm}$, or failure of scanning, should be avoided since this may cause damage to the photoconductive layer.
2a) The position of this marker line corresponds with the position of the small area contact on the ceramic centring ring. The spring contact in the coil unit, AT1115, is located accordingly. Total possible rotation of the tube while maintaining contact, is approx. $30^{\circ}$.

2 b ) The outer diameter of the ceramic centring ring is concentric with the inner diameter of the mesh ring (grid no. 6). In the AT1115 coil unit the tube is centred' with this ring as a reference; this ensures proper optical alignment of the tube in the optical system of a colour camera.
3) When the tube is to be used without Anti-Comet Tail action, grid no. 3 (auxiliary grid) should be connected to grids no. 2 and no. 4 and no A.C.T. pulses should be applied to the cathode and grid no. 1 (control grid). The performance of the tube will then be as déscribed herein with the exception of the highlight handling.
4) Blanking can also be applied to the cathode:
a. -without A.C.T. action (see note 3): required cathode pulse approx. 25 V .
b. -with A.C.T. action: timing, polarity and amplitudes of the A.C.T. pulses will have to be adapted.
5) Pulse timing and amplitudes for A.C.T. action (CCIR system) (blanking on grid no. 1) 4) 7)
For proper operation of the A.C.T. electrode gun three pulses are required, being: a. - A positive-going pulse on the cathode with an adjustable amplitude of 0 to 15 V . This pulse can be chosen to coincide with the full line-blanking period.
b. - A positive-going pulse on gridno. 1 (control grid) with an adjustable amplitude of 25 to 40 V .
The duration of this pulse should be chosen such that it just includes the fly back period ( $\approx 5 \mu \mathrm{~s}$ ) of the line deflection (e.g. $\approx 6 \mu \mathrm{~s}$ ).
c. - A negative-going pulse on grid no. 3 (auxiliary grid) with an amplitude of approx. 250 V , adjusted to result in a $\mathrm{Vg}_{3}$ voltage during the A . C. T. mode of 0 to 30 V .
Duration of chis pulse should be equal to that of the grid no. 1 pulse.

The timing diagram is as follows:

$\mathrm{A}=$ Line blanking period: $\approx 12 \mu \mathrm{~s}, \mathrm{~V}_{\mathrm{k}}$ pulse
$B=A . C . T$. period: $\approx 5 \mu$ s, grids no. 1 and no. 3 pulses
$\mathrm{C}=$ Line flyback period: $\approx 5 \mu \mathrm{~s}$
$\mathrm{D}=$ Clamping time: 2 to $3 \mu \mathrm{~s}$
6) For short intervals. During storage the tube face shall be covered with the plastic hood provided; when the camera is idle the lens shall be capped.
7) a. Read-out mode: defined as the operating conditions during the active line scan (full line period -line blanking interval).
For the CCIR system this will amount to $64 \mu \mathrm{~s}-12 \mu \mathrm{~s}=52 \mu \mathrm{~s}$.
b. A.C.T. mode: defined as the operating conditions during that part of the line blanking interval during which the A.C.T. electrode gun is fully operative. The A.C.T. interval is equal to or slightly overlaps the line flyback time.
8) Pulse amplitude settings

Cathode pulse $\mathrm{V}_{\mathrm{k}}$ : adjusted to obtain an A . C. T. limiting level at 1.3 to 1.5 times $\mathrm{I}_{\mathrm{Sp}}$.
Grid no. 3 pulse : adjusted for maximum and most uniform A.C.T. action over the total scanned area.
Grid no. 1 pulse : adjusted for proper handling of a highlight with a diameter of $10 \%$ of picture height and with a brightness corresponding to 32 times peak signal white ( $\mathrm{I}_{\mathrm{sp}}$ ).
N. B. Extension of the A.C.T. range can be obtained by increasing the grid no. 1 pulse; this may, however, introduce dark current.
9a) The D. C. voltage supply and/or pulse supply to these electrodes should have a sufficiently low impedance to prevent distortion caused by the peak currents drawn during the A.C.T. mode.
These peak currents may amount to:

| cathode | 2 mA |
| :--- | ---: |
| grid no. 1 | 0 mA |
| grids no. 2 and no. 4 | 1 mA |
| grid no.3 | $150 \mu \mathrm{~A}$ |
| grid no.5 | $300 \mu \mathrm{~A}$ |
| grid no.6 | $300 \mu \mathrm{~A}$ |

The cathode impedance should preferably be chosen $\leq 300 \Omega$.

9b) Video pre-amplifier. In the presence of highlights, peak signal currents of the order of $15-45 \mu \mathrm{~A}$ may be offered to the pre-amplifier during flyback. Special measures have to be taken in the pre-amplifier to prevent temporary overloading.
10) Plumbicon tubes do not permit automatic sensitivity control be means of regulation of the signal electrode voltage. Adequate control is therefore to be achieved by other means (iris control and neutral density filters).
If the tube is applied in cameras originally designed for vidicon tubes, the automatic sensitivity control circuitry should be made inoperative and the signal electrode voltage set to 45 V .
11) The optimum voltage ratio $\mathrm{V}_{6} / \mathrm{V}_{\mathrm{g}}$ to obtain minimum beam landing errors (preferably $\leq 1 \mathrm{~V}$ ) depends on the type of coil unit used. For type AT1115 a ratio of 1.5:1 to $1.6: 1$ is recommended.
12) Operation with $\mathrm{A} . \mathrm{C} . \mathrm{T}$. at $\mathrm{Vg}_{6}>750 \mathrm{~V}$ is not recommended since this may introduce dark current.
13) Adjusted with the A.C.T. made inoperative, e.g. by setting the cathode pulse to 15 V . The control grid voltage is adjusted to produce a beam current just sufficient to allow a peak signal current of twice the typical value, $I_{S p}$, as observed and measured on a waveform oscilloscope. This amount of beam current is termed $\mathrm{Ib}_{\mathrm{p}}$.
N.B. The signal current, $I_{s}$, and beam current, $I_{b}$, conditions quoted with the performance figures for e.g., lag, relate to measurements with an integrating instrument connected in the signal-electrode lead and a uniform illumination on the scanned area.
The corresponding peak currents, $\mathrm{I}_{\mathrm{Sp}}$ and $\mathrm{I}_{\mathrm{b}_{\mathrm{p}}}$, as measured on a waveform oscilloscope will be a factor $\alpha$ larger ( $\alpha=100 / 100-\beta$ ), $\beta$ being the total blanking time in \%; for CCIR system $\alpha$ amounts to 1.33 .
14) In the case of a black/white camera the illumination on the photoconductive lay$\mathrm{er}, \mathrm{B}_{\mathrm{ph}}$, is related to scene illumination, $\mathrm{B}_{\mathrm{Sc}}$, by the formula:

$$
\mathrm{B}_{\mathrm{ph}}=\mathrm{B}_{\mathrm{Sc}} \frac{\text { R.T. }}{4 \mathrm{~F}^{2}(\mathrm{~m}+1)^{2}}
$$

in which R represents the average scene reflectivity or the object reflectivity, whichever is relevant, $T$ the lens transmission factor, $F$ the lens aperture, and m the linear magnification from scene to target.
A similar formula may be derived for the illumination level on the photoconductive layers of the R, G, and Btubes in which the effects of the various components of the complete optical system have been taken into account.
15) Focus current adjusted for correct electrical focus. The direction of the focusing current shall be such that a north seeking pole is attracted towards the image end of the focusing coil, with this pole located outside of and at the image end of the focusing coil.
16) Measuring conditions:

Illumination 4lx (luminious flux $=0.5 \mathrm{mlm}$ ) at black body temperature of 2854 K ; the appropriate filter inserted in the light path.

Filters used:

| XQ1080R | Schott | OG570 | thickness | 3 mm |
| :--- | :--- | :--- | :--- | :--- |
| XQ1080G | Schott | VG9 | thickness | 1 mm |
| XQ1080B | Schott | BG12 | thickness | 3 mm |

For transmission curves see page 13 .
17) Gamma-stretching circuitry is recommended.
18) Typical faceplate illumination level for the XQ 1080 to produce $0.2 \mu \mathrm{~A}$ signal current will be approx. 41 x . The signal current stated for the colour tubes R, G, B will be obtained with an incident white light level (c.t. $=2854 \mathrm{~K}$ ) on the filter of approx. 10 lx . These figures are based on the filters described in note 16). For filter BG12, however, a thickness of 1 mm is chosen.
19) The horizontal amplitude response can be raised by the application of suitable correction circuits, whichaf fectsneither the vertical resolution nor the limiting resolution.
20) After 10 seconds of complete darkness. The figures given represent typical per centages of the ultimate signal current obtained 60 ms respectively 200 ms after the illumination has been applied.
21) After a minimum of 5 s of illumination on the target. The figures given represent typical residual signals in $\%$ of the original signal current 60 ms respectively 200 ms after the illumination has been removed.
22) The special socket incorporates a small incandescent light bulb ( $6 \mathrm{~V}, 1 \mathrm{~W}$ ), which projects its light on to the pumping stem via a blue-green transmitting filter. The light is conducted via a fine glass rod (lightpipe) to cause a bias illumination on the target. The desired amount of bias light can be obtained by adjusting the cur rent throught the filament of the small bulb.
23) For $\mathrm{bl} / \mathrm{wh}$ operation a bias lighting, corresponding to 2 to 3 nA extra dark current, is usually adequate for excellent speed of response.
In a colour camera the speeds of response of the tubes can be balanced by adjusting the amount of bias lighting per tube.

## GENERAL AND RECOMMENDATIONS

1. During transport, handling and storage the axis of the Plumbicon must be either vertical, with faceplate up, or horizontal; the faceplate should be covered with the hood provided.
2. This series of Plumbicon tubes is provided with Kovar pins and therefore requires no more care in handling than vidicon tubes.
3. During long term storage the ambient temperature should not exceed $30^{\circ} \mathrm{C}$.
4. In isolated cases the properties of a Plumbicon may deteriorate slightly when it is kept idle for long periods such as may occur:

- between the factory's pre-shipment test and the actual delivery to the customer;
- between receipt of the tube and its installation;
- when the camera is not used for a long time.

Although the changes of such deterioration are remote it is advisible to operate the tube for some hours at intervals not more than 4 weeks apart.

The following procedure and conditions are recommended:

- Set grid no. 1 bias control to maximum negative bias (beam cut-off).
- Allow a heating -up time of the cathode of at least one minute before turning up the grid no. 1 bias control to produce a beam.
- Set scanning amplitudes to overscan condition.
- Apply an even illumination to the target to obtain a signal current of approx. o. $15 \mu \mathrm{~A}$ and adjust the beam current for correct stabilization.

The signal electrode connection is made by a spring contact, which is part of the focusing coil assembly, and is kept pressed against the signal electrode ring.

Electrostatic shielding of the signal electrode is required to avoid interference effects in the picture. Effective shielding is provided by one grounded shield inside the focusing coil at the faceplate end, and one inside the deflecting yoke.

The light transfer characteristic of the Plumbicon tube having a gamma near unity, it may be desirable to incorporate a gamma correcting circuitry in the video-amplifier system with an adjustable gamma of 0.5 of 1 .

The Plumbicon tube not generating noise to any noticeable extent, the signal-tonoise ratio will be determined mainly by the input noise of the video-amplifier system.

The high sensitivity of the Plumbicon tube warrants pictures with excellent sig-nal-to-noise ratio under normal lighting conditions provided its output is fed into a well-designed input stage of the video-amplifier system. In such a system an aperture correction may be incorporated to ensure an attractive gain in resolving power without impairing the signal to noise ratio.

## INSTRUCTIONS FOR USE

Instructions for use are packed with each tube.

Transmission of filters OG570, VG9 and BG12. See note 16

Square wave modulation transfer characteristic

## CAMERA TUBES

Plumbicon ${ }^{*}$, sensitive high-definition pick-up tube with lead-oxide photoconductive target. Provided with: separate mesh construction for good overall resolution; Anti--Comet Tail electron gun for improved highlight handling; lightpipe for reduced lag under low-key conditions; fibre optic faceplate. The tubes of the XQ1220 and XQ1230 series can be used in medical, scientific and low light level T.V. systems in which they can be coupled direct to, e.g., X-ray image intensifiers and light intensifiers with fibre optic output windows.

## NOTES

1) All figures quoted in these data sheets refer to a scanned area of $12.8 \times 17.1 \mathrm{~mm}^{2}$. Underscanning of the once chosen area or failure of scanning should be avoided since this may cause damage to the photoconductive target.
${ }^{2}$ ) For short intervals. During storage and idle periods the tube face must be covered with the plastic hood provided for the purpose, or the lens be capped.
${ }^{3}$ ) For optimal screening of the signal-electrode from the live end of the line deflection coils the AT1132/01 is recommended.
${ }^{4}$ ) When the tube is to be used without Anti-Comet Tail action, grid no. 3 (auxiliary grid) should be connected to grids no. 2 and no. 4 and no A.C.T. pulses should be applied to the cathode and grid no. 1 (control grid). The performance of the tube will then be as described herein with the exception of the highlight handling.
2) a. Read-out mode: defined as the operating conditions during the active line scan (full line period - line blanking interval).
For the CCIR system this will amount to $64 \mu \mathrm{~s}-12 \mu \mathrm{~s}=52 \mu \mathrm{~s}$.
b. A.C.T. mode: defined as the operating conditions during that part of the line blanking interval during which the A.C.T. electrode gun is fully operative. The A.C.T. interval is equal to or slightly overlaps the line flyback time.
6. Pulse timing and amplitudes for A.C.T. action (CCIR system)
(blanking on grid no. 1)
For proper operation of the A.C.T. electrode gun three pulses are required, being: a. - a positive-going pulse on the cathode with an adjustable amplitude of 0 to 10 V .
b. - a positive-going pulse on grid no. 1 (control grid) of fixed amplitude of 30 to 35 V . The duration of this pulse should be chosen such that it just includes the flyback period ( $\approx 5 \mu \mathrm{~s}$ ) of the line deflection (e.g. $6 \mu \mathrm{~s}$ ).
c. - a negative-going pulse on grid no. 3 (auxiliary grid) with an amplitude of approx. 240 V , adjusted for a $\mathrm{V}_{\mathrm{g} 3}$ voltage during the $\mathrm{A} . \mathrm{C}$. T. interval of 0 to 10 V .
Duration and timing of this pulse should be equal to those of the gridno. 1 pulse.

The timing diagram is as follows:

$\mathrm{A}=$ Line blanking period: $\approx 12 \mu \mathrm{~s}, \mathrm{~V}_{\mathrm{k}}$ pulse
$B=A . C . T$. period: $\approx 6 \mu$ s, grids no. 1 and no. 3 pulses
$\mathrm{C}=$ Line flyback period: $\approx 5 \mu \mathrm{~s}$
$\mathrm{D}=$ Clamping time: 2 to $3 \mu \mathrm{~s}$
7) The D.C. voltage supply and/or pulse supply to these electrodes should have a sufficiently low impedance to prevent distortion caused by the peak currents drawn during the A.C.T. mode.
These peak currents may amount to:

| grid no. 1 | 0 mA |
| :--- | ---: |
| grids no. 2 and no. 4 | 1 mA |
| grid no. 3 | $150 \mu \mathrm{~A}$ |
| grid no. 5 | $300 \mu \mathrm{~A}$ |
| grid no. 6 | $300 \mu \mathrm{~A}$ |

${ }^{8}$ ) Adjusted, with the A. C. T. switched off, to produce a beam current $\mathrm{I}_{\mathrm{b}}=300 \mathrm{nA}$. $\mathrm{I}_{\mathrm{b}}$ is not the actual current available in the scanning beam, but is defined as the maximum amount of signal current, $I_{S}$, that can be obtained with this beam.

In the performance figures e.g. for resolution and lag the signal current and beam current conditions are given as $\mathrm{I}_{\mathrm{S}} / \mathrm{I}_{\mathrm{b}}=20 / 300 \mathrm{nA}$.
This hence means: with a signal current of 20 nA and a beam setting which just allows a signal current of 300 nA .
N.B. The signal currents are measured with an integrating instrument connected in the signal-electrode lead, and an uniform illumination on the scanned area. The peak signal currents as measured on a waveform oscilloscope will be a factor $\alpha$ larger $\left(\alpha=\frac{100}{100-\beta}\right), \beta$ being the total blanking time in \%; for CCIR system $\alpha$ amounts to 1.33).
${ }^{9}$ ) Blanking can also be applied to the cathode:
a. - without A.C.T. action (see note 4): required cathode pulse approx. 25 V .
b. - with A.C.T. action: timing, polarity and amplitudes of the A.C.T. pulses will have to be adapted.
10) The figures shown represent the signal output current in $\mu \mathrm{A}$ obtained per $\mu \mathrm{W}$ of electrical input power into a P11 or P20 phosphor on a fibre optic output window of e.g. an image intensifier or a converter tube.
Such an output window will usually be provided with non-cladded fibre optics when it feeds into an XQ1220 and with black-cladded fibre optics when it is coupled to an XQ1230.
The figures were obtained as the products $\mathrm{S} \times \mathrm{T}_{1}^{2} \times \eta$ or $\mathrm{S} \times \mathrm{T}_{2}^{2} \times \eta$ (see table below) whichever applied.

|  |  | symbol | P11 | P20 | unit |
| :---: | :--- | :---: | ---: | ---: | :---: |
| Plumbicon <br> target | Sensitivity of photoconductive <br> target |  | 1800 | 290 | $\mu \mathrm{~A} / 1 \mathrm{~m}$ |
|  | Conversion factor Watt to lumen | Sensitivity of photoconductive <br> target | S | 0.25 | 0.14 |
| Fibre <br> optics | Transmission of a non-cladded <br> fibre plate | $\mathrm{T}_{1} *$ | 90 | 90 | $\%$ |
|  | Transmission of a black-cladded <br> fibre plate | $\mathrm{T}_{2} *$ | 70 | 70 | $\%$ |
| Phosphor | Luminous efficiency of phosphor | $\eta^{* *}$ | 10 | 14 | $\%$ |

* For the sake of simplicity it is assumed that the fibre optics in the output window and in the Plumbicon faceplate have identical transmissions.
** The phosphors being usually metal-backed, the figures for the luminous efficiencies have been corrected for the effects of the backing.

11) Measured with a test transparency with the emulsion side in direct contact with the faceplate and which is illuminated with diffused light (lambertian illumination). The test transparency has square wave patterns in a white background.
The figures given relate to a low frequency reference obtained from a square wave pattern of $1.0 \mathrm{lp} / \mathrm{mm}(330 \mathrm{kHz})$.
${ }^{12}$ ) After 10 seconds of complete darkness. The figures given represent typical percentages of the ultimate signal current obtained 60 ms respectively 200 ms after the illumination has been applied.
12) After a minimum of 5 s of illumination on the target. The figures given represent typical residual signals in $\%$ of the original signal current 60 ms respectively 200 ms after the illumination has been removed.
13) The special socket incorporates a small incandescentlight bulb ( $6 \mathrm{~V}, 1 \mathrm{~W}$ ), which projects its light on the pumping stem via a blue-green transmitting filter. The light is conducted via a fine glass rod (lightpipe) to cause a bias illumination on the target. The desired amount of bias light can be obtained by adjusting the current through the filament of the small bulb.

## GENERAL AND RECOMMENDATIONS

1. During transport, handling and storage the axis of the Plumbicon must be either vertical, with faceplate up, or horizontal; the faceplate must be kept covered with the hood provided for the purpose.
2. To avoid damage to the tungsten basepins, the Plumbicon should be inserted into its socket with care, avoiding undue forces and bending loads on the pins.
3. During long-term storage the ambient temperature should preferably not exceed $30^{\circ} \mathrm{C}$.
4. In isolated cases the properties of a Plumbicon may deteriorate slightly when it is kept idle for long periods such as may occur:
. between the factory's pre-shipment test and the actual delivery to the customer.

- between receipt of the tube and its installation.
. if the camera is not used for a long time.
Although the chances of such deterioration are remote it is advisable to operate the tube for some hours at intervals not more than 4 weeks apart.
The following procedure and conditions are recommended:
- Set grid no. 1 bias-control to maximum negative bias (beam cut-off).
- Allow a heating-up time of the cathode of at least one minute before turning up the grid no. 1 bias-control to produce a beam.
- Set scanning amplitudes to overscan condition.
- Apply an even illumination to the target to obtain a signal current of approx. $0.15 \mu \mathrm{~A}$ and adjust the beam current for correct stabilization.

5. The signal electrode connection is made by a spring contact, which is part of the focusing coil unit and is kept pressed against the signal electrode ring.

6 Electrostatic shielding of the signal electrode is required to avoid interference effects in the picture. Effective shielding is provided by one grounded shield inside the focusing coil at the faceplate end, and one inside the deflecting yoke.
7. The Plumbicon tube not generating own noise to any noticeable extent, the signal--to-noise ratio will be determined mainly by the input noise of the video-amplifier system.

The high sensitivity of the Plumbicon tube warrants pictures with excellent signal--to-noise ratio under normal lighting conditions provided its output is fed into a well-designed input stage of the video-amplifier system. In such a system an aperture correction may be incorporated to ensure an attractive gain in resolving power without visually impairing the signal-to-noise ratio.

Typical signal output characteristics in A.C.T. operation
Scanning area: $12.8 \times 17.1 \mathrm{~mm}^{2}$
Beam current : just sufficient to stabilize 500 nA signal current

## CAMERA TUBE

Vidicon television camera tube with low heater consumption, separate mesh construction, magnetic focusing, magnetic deflection and 25.4 mm ( 1 in ) diameter intended for use in black-and-white and colour television cameras in industrial, medical and broadcast applications.

|  | QUICK REFERENCE DATA |
| :--- | :--- |
| Separate mesh |  |
| Focusing | magnetic |
| Deflection | magnetic |
| Diameter | $25.4 \mathrm{~mm}(1 \mathrm{in})$ |
| Length | $159 \mathrm{~mm}\left(6 \frac{1}{4} \mathrm{in}\right)$ |
| Heater | $6.3 \mathrm{~V}, 95 \mathrm{~mA}$ |
| Resolution | $\geq 1000 \mathrm{TV}$ lines |

The electrical and mechanical properties of the two types are essentially identical, the differences being found in the degree of freedom from blemishes of the photoconductive layers, in the sensitivity and the signal electrode voltage range.

XQ1240 - intended for use in industrial, medical and broadcast applications in which a high standard of performance is required.

XQ1241 - general purpose tube for less critical industrial applications, experiments, amateur use etc.

## OPTICAL

Diagonal of quality rectangle on photoconductive layer (aspect ratio $3: 4$ ) max.

16 mm
Orientation of image on photoconductive layer:
The direction of the horizontal scan should be essentially parallel to the plane defined by the short index pin and the longitudinal axis of the tube.
Photoconductive layer
Spectral response, max. response at

## HEATING

Indirect by A.C. or D.C.;parallel and series supply

| Heater voltage | $\mathrm{V}_{\mathrm{f}}$ | 6.3 | $\mathrm{~V} \pm 10 \%$ |
| :--- | :--- | ---: | :--- |
| Heater current | $\mathrm{I}_{\mathrm{f}}$ | 95 | mA |

When the tube is used in a series heater chain, the heater voltage must not exceed $9.5 \mathrm{~V}_{\mathrm{rms}}$ when the supply is switched on.
Data based on pre-production tubes

## CAPACITANCES

Signal electrode to all
This capacitance, which effectively is the output impedance of the tube, increases when the tube is inserted into the deflection and focusing coil unit.

Average $\gamma$ of transfer characteristic for signal currents between $0.01 \mu \mathrm{~A}$ and $0.3 \mu \mathrm{~A}$
Spurious signals (spots and blemishes)

See note 9)

## NOTES

1) The optimal grid no. 4 voltage for best uniformity of black and white level depends on the type of coil unit used and will be 1.4 times $\mathrm{V}_{\mathrm{g} 3}$ for the coil units mentioned under "Accessories".
Under no circumstances should grid no. 4 (mesh) be allowed to operate at a voltage level below the $\mathrm{V}_{\mathrm{g} 3}$ level, since this may damage the target.
2) Because of the higher deflecting and focusing power required to produce adequate field strength the tube temperature will increase and adequate provisions for cooling should be made.
3) The polarity of the focusing coil should be such that a north-seeking pole is at tracted to the image end of the focusing coil, with this pole located outside of and at the image end of the focusing coil.
4) The alignment coil unit should be positioned on the tube so that its centre is at a distance of approx. $94 \mathrm{~mm}(311 / 16 \mathrm{in}$ ) from the face of the tube and that its axis coincides with the axis of the tube, the deflecting yoke and the focusing coil.
5) Signal-electrode voltage adjusted for a dark current of 20 nA .
6) Signal current is defined as the component of the output current after the dark current has been subtracted.
7) Measured with a video amplifier system having an appropriate bandwidth.
8) Square wave response. Measured with a lens aperture of f5.6, a peak signal cur. rent $I_{S p}=0.15 \mu \mathrm{~A}$ and a beam current sufficient to stabilize a signal current of $0.5 \mu \mathrm{~A}$.
9) Conditions:

The camera focused on a uniformly illuminated two-zone test pattern, the diameter of the centre zone (1) being equal to the raster height. Zone (2) being defined as the remainder of the scanned area. Signal electrode voltage adjusted for a dark current of 20 nA , illumination on the target 8 lx , (c.t. $=2854^{\circ} \mathrm{K}$ ).

Scanning amplitudes of the monitor adjusted to obtain a raster with an aspect ratio of 3:4.

Monitor set-up and contrast control adjusted for faint raster when lens of camera is capped, and for non-blooming bright raster when lens of camera is uncapped.

Under the above conditions the number and size of the spots visible in the monitor picture will not exceed the limits stated below. Both black and white spots must be counted unless the amplitude is less than $10 \%$ (XQ1240), or less than $25 \%$ (XQ1241) of the peak white signal.

XQ1240

| Spot size <br> in \% of raster height | Maximum number of spots <br> zone 1 |  |
| :---: | :---: | :---: |
| $>1$ | none | zone 2 |
| 1 to 0.6 | none | none |
| 0.6 to 0.2 | 1 | 2 |
| $\leqslant 0.2$ | $*$ | $*$ |

XQ1241

| Spot size in \% of raster height | Maximum number of spots zone $1 \quad$ zone 2 |
| :---: | :---: |
| $>1$ | none none |
| 1 to 0.6 | $1 \quad 3$ |
| m 0.6 to 0.2 | 3 5 |
| $\leqslant 0.2$ | * * |
|  | max. 8 |

* Do not count spots of this size unless concentration causes a smudgy appearance.
a) Minimum separation between any two spots greater than $0.2 \%$ of raster height is limited to a distance equivalent to $5 \%$ of raster height.
b) Tubes are rejected for smudge, lines, streaks, mottled, grainy or uneven background having contrast ratios in excess of $10 \%$ (XQ1240), respectively $25 \%$ (XQ1241).

## CAMERA TUBE

Plumbicon*, sensitive high-definition pick-up tube with photoconductive target and low velocity stabilization.
The 55875 is intended for use in black and white; the $L, R, G$, and $B$ versions for use in four and three tube colour studio cameras.

## NOTES

${ }^{1}$ ) Underscanning of the specified useful target area of $12.8 \mathrm{~mm} \times 17.1 \mathrm{~mm}$, or failure of scanning, should be avoided since this may cause damage to the photoconductive layer.
${ }^{2}$ ) For correct orientation of the image on the photoconductive layer the vertical scan should be essentially parallel to the plane passing through the tube axis and the mark on the tube base.
${ }^{3}$ ) Measuring conditions:
Illumination 4.54 lx at black body colour temperature of 2850 K ; the appropriate filter inserted in the light path. The signal current obtained in nA is a measure of the colour sensitivity expressed in $\mu \mathrm{A}$ per lumen of white light before the filter.
Filters used:

| 55875R | Schott | OG2 | thickness | 3 mm |
| :--- | :--- | :--- | :--- | :--- |
| 55875G | Schott | VG9 | thickness | 1 mm |
| 55875B | Schott | BG12 | thickness | 3 mm |

See page 8 for transmission curves.
${ }^{4}$ ) a) Gamma is, to a certain extent, dependent on the wavelength of the illumination applied.
b) The use of gamma-stretching circuitry is recommended.
5) The capacitance $\mathrm{C}_{\mathrm{a}_{\mathrm{S}}}$ to all, which effectively is the output impedance, increases when the tube is inserted into the deflecting/focusing coil assembly.
6) For focusing/deflection coil assembly, see under "Accessories".
7) Without blanking voltage on grid No. 1 .
8) At $V_{k}=0 \mathrm{~V}$.
${ }^{9}$ ) For short intervals. During storage the tube face shall be covered with the plastic hood provided; when the camera is idle the lens shall be capped.
10) The signal electrode voltage shall be adjusted to 45 V . To enable the tube to handle excessive highlights in the scene to be televised the signal electrode voltage may be reduced to a minimum of 25 V , this will, however, result in some reduction in performance, especially in respect of sensitivity.
11) The beam current shall be adjusted for correct stabilization of the highlight signal currents stated in the table.
12)

| 100 | 235 | 35 |
| (approx. values) |  |  |

## 55875 <br> 55875 L 55875 R,G,B

13) Typical faceplate illumination level for the 55875 and 55875 L to produce $0.3 \mu \mathrm{~A}$ signal current will be approx. 4 lx . The signal currents stated for the colour tubes 55875 R, G, B respectively will be obtained with an incident white light level ( 2850 K ) on the filter of approx. 10 lx . These figures are based on the filters described in note 3, for filter BG12 however a thickness of 1 mm is chosen.
${ }^{14}$ ) In the case of a black/white camera the illumination on the photoconductive layer, $\mathrm{B}_{\mathrm{ph}}$, is related to scene illumination, $\mathrm{B}_{\mathrm{Sc}}$, by the formula:

$$
\mathrm{B}_{\mathrm{ph}}=\mathrm{B}_{\mathrm{sc}} \frac{\mathrm{R} \cdot \mathrm{~T}}{4 \mathrm{~F}^{2}(\mathrm{~m}+1)^{2}}
$$

in which $R$ represents the average scene reflectivity or the object reflectivity, whichever is relevant, $T$ the lens transmission factor, $F$ the lens aperture, and $m$ the linear magnification from scene to target.
A similar formula may be derived for the illumination level on the photoconductive layers of the $R, G$, and $B$ tubes in which the effects of the various components of the complete optical system have been taken into account.
15) The horizontal amplitude response can be raised by the application of suitable correction circuits, which affects neither the vertical resolution, nor the limiting resolution.
16) The stated ratio represents the "visual equivalent signal-to-noise ratio", which is taken as the ratio of highlight video-signal current to RMS noise current, multiplied by a factor of 3 , assuming an RMS noise current of the video pre-amplifier of 2 nA , bandwidth 5 MHz .

## GENERAL RECOMMENDATIONS

1. During transport, handling and storage the axis of the Plumbicon must be either vertical, with faceplate up, or horizontal; the faceplate should be covered with the hood provided.
2. To avoid damage to the tungsten basepins, the Plumbicon should be inserted into its socket with care. Shocks, undue force, and bending loads on the pins are to be avoided.
3. During long term storage the ambient temperature should not exceed $30^{\circ} \mathrm{C}$.
4. In isolated cases the properties of a Plumbicon may deteriorate slightly when it is kept idle for long periods such as may occur :
. between the factory's pre-shipment test and the actual delivery to the customer;
. between receipt of the tube and its installation;
. when the camera is not used for a long time.
Although the chances of such deterioration are remote it is advisable to operate the tube for some hours at intervals not more than 4 weeks apart.

The following procedure and conditions are recommended:
. Set grid no. 1 bias control to maximum negative bias (beam cut-off):
. Allow a heating-up time of the cathode of at least one minute before turning up the grid no. 1 bias control to produce a beam.
. Set scanning amplitudes to overscan condition.

- Apply an even illumination to the target to obtain a signal current of approx. $0.15 \mu \mathrm{~A}$ and adjust the beam for correct stabilization.

5. The signal electrode connection is made by a springcontact, which is part of the focusing coil assembly, and is kept pressed against the signal electrode ring.
6. Electrostatic shielding of the signal electrode is required to avoid interference effects in the picture. Effective shielding is provided by a grounded shield inside the focusing coil at the faceplate end, and one inside the deflecting yoke.
7. The light transfer characteristic of the Plumbicon tube being characterized by a gamma near unity, it may be desirable for broadcast applications to incorporate a gamma correcting circuitry in the video-amplifier system with an adjustable gamma of 0.5 to 1 .

It is suggested to design this gamma correcting circuitry such that an extra compression can be introduced by manual control in the video signal range of $75 \%$ to $100 \%$ of normal peak white level.

This provision will prevent the video-amplifier system from becoming overloaded when the Plumbicon tube is exposed to scenes containing small peaked highlights as caused by reflections of shiny objects.
8. The Plumbicon tube not generating own noise to any noticeable extent, the signal-to-noise ratio will be determined mainly by the entrance noise of the video-amplifier system.

The high sensitivity of the Plumbicon tube warrants pictures with excellent sig-nal-to-noise ratio under normal studio lighting conditions provided its output is fed into a well-designed input stage of the video-amplifier system. In such a system an aperture correction may be incorporated to ensure an attractive gain in resolving power without visually impairing the signal-to-noise ratio.

## INSTRUCTIONS FOR USE

Instructions for use are packed with each tube.

## CAMERA TUBE

Plumbicon*, sensitive pick-up tube with lead-oxide photoconductive target and low velocity stabilization.

The tubes of this series are mechanically and electrically identical to the tubes of the 55875 series, the only difference being the degree of freedom from blemishes of the photoconductive target.

The tubes are intended for industrial and educational black and white and colour cameras. The series comprises the following versions:

$$
\begin{array}{ll}
55875-\text { IG } & \text { for black and white cameras } \\
55875 R-\text { IG } & \\
55875 \text {-IG } & \text { for use in the chrominance channels of colour cameras } \\
55875 \text {-IG } &
\end{array}
$$

For all further information see data of the 55875 series.

[^27]

| :--- | :--- | ---: | :--- |
| Heater current | $\mathrm{I}_{\mathrm{f}}$ | 90 | mA |

1) All underscanning of the specified useful target-area of 18.0 mm diameter or failure of scanning, should be carefully avoided, since this may cause permanent damage to the photoconductive layer.
2) The area beyond the 18.0 mm circular optical image preferably to be covered by a mask.
${ }^{3}$ ) Direction of vertical scan should be essentially parallel to the plane passing through the tube axis and the mark on the tube base.
3) The near unity gamma of the $55876 / 01$ ensures good contrast when televising low contrast X-ray image-intensifier pictures as encountered in radiology. Further contrast improvement may be obtained when an adjustable gamma expansion circuitry is incorporated in the video amplifier system.

## 55876/01

## Resolution

approx. 200:1 ${ }^{3}$ )

## GENERAL RECOMMENDATIONS AND INSTRUCTIONS FOR USE

## MOUNTING, WORKING POSITION

## 1. Any

2. During transport, handling or storage the longitudinal axis must either be in a horizontal position or be kept vertically with the face-plate of the tube up.
3 . During long term storage the ambient temperature should not exceed $30^{\circ} \mathrm{C}$.
${ }^{1}$ ) With a signal current of $0.10 \mu \mathrm{~A}$ and a beam current of $0.20 \mu \mathrm{~A}$.
2) Horizontal amplitude response can be raised by the application of suitable phase-and-aperture correction circuits. Such compensation, however, does not affect vertical resolution, nor does it influence the limiting resolution.
${ }^{3}$ ) The specified ratio represents the "visual equivalent signal-to-noise ratio", which is taken as the ratio of highlight video-signal current to R.M.S. noise-current, multiplied by a factor of 3. (Assuming an R.M.S. noise-current of the video preamplifier of $2 \cdot 10^{-9} \mathrm{~A}$, bandwidth 5 MHz .)

## GENERAL

1. Signal electrode connection is made by a suitable spring-contact which is executed as part of the focusing coil.
2. Electrostatic shielding of the signal-electrode is required in order to avoid interference effects in the picture. Effective shielding is provided by grounding shields on the inside of the faceplate end of the focusing coil and on the inside of the deflecting yoke.
3. The Plumbicon as described in these data has been provided with tungsten base pins. It is recommended to avoid mechanical force and shocks to these pins and to insertt the tube into its socket with care.
4. In isolated cases the properties of a Plumbicon may deteriorate slightly when it is kept idle for long periods such as may occur:
. between the factory's pre-shipment test and the actual delivery to the customer;

- between receipt of the tube and its installation;
. when the camera is not in use for a long time.
Although the chances of such deterioration are remote it is advisable to operate the tube for some hours at intervals not more than 4 weeks apart.

The following procedure and conditions are recommended:
. Set grid no. 1 bias control to maximum negative bias (beam cut-off).
. Allow a heating-up time of the cathode of at least one minute before turning up the grid no. 1 bias control to produce a beam.
. Set scanning amplitudes to overscan condition.
. Apply an even illumination to the target to obtain a signal current of approx. $0.15 \mu \mathrm{~A}$ and adjust the beam for correct stabilization.
5. The Plumbicon not generating own noise to any noticeable extent, the signal-tonoise ratio will mainly be determined by the entrance noise of the video amplifier system.
The high sensitivity of the Plumbicon warrants pictures with excellent signal-to-noise ratio, provided its output is fed into a well-designed input stage of the video-amplifier system. In such a system an aperture correction may be incorporated to ensure an attractive gain in resolving power without impairing the visual signal-to-noise ratio.

## INSTRUCTIONS FOR USE

$\min$. 10 kV
Photocathode illumination, continuous
(see note 8)
$\max$. 2.0 lux
Ambient temperature
$t_{\text {amb }} \max .+50{ }^{\circ} \mathrm{C}$

## NOTES

1. Luminance gain is defined as $\frac{\pi \cdot \mathrm{L}_{\mathrm{o}}}{\mathrm{E}_{\mathrm{i}}}$
where $L_{O}=$ luminance $\left(\mathrm{cd} / \mathrm{m}^{2}\right)$ in a direction normal to the screen, measured with an eye-corrected photometer having an acceptance angle of less than 2 degrees.
and $\quad E_{i}=$ illumination (lux) incident on a 19 mm diameter concentric area of the cathode, produced by a tungsten lamp at a colour temperature of $2850{ }^{\circ} \mathrm{K}$.
2. This is the magnification of a 2 mm diameter concentric circle on the photocathode, as measured on the screen.
3. Percentage distortion $=\left(\frac{M_{d}}{M_{C}} \times 100\right)$, where $M_{d}$ is the magnification at a distance of 10 mm from the centre of the photocathode and $\mathrm{M}_{\mathrm{C}}$ is the magnification at a distance of 1 mm from the centre of the photocathode.
4. Measured at the centre of the photocathode.
5. Measured at the photocathode at a distance of 7 mm from the centre.
6. This is the value of input illumination required to give an increase in screen luminance equivalent to the background luminance.
7. Permanent damage may result from a temporary reversal of polarity.
8. This figure assumes uniform illumination of the photocathode. Permanent damage may result if the tube is exposed to radiant power sogreat as to cause excessive heating of the photocathode.

## GENERAL OPERATIONAL RECOMMENDATIONS PHOTOTUBES

## 1. GENERAL

1.1 Photo tubes are photo-electric devices of the emissive type, as distinct from the barrier-layer and photo-conductive cells. They may be divided into two groups:

1. High-vacuum photo tubes,
2. Gas-filled photo tubes

Each of these groups can be subdivided into red sensitive and blue sensitive photo tubes; the spectral response depending upon the photocathode material. For the blue sensitive photo tubes the " $A$ " type of cathode is used (caesiumantimony).
For the red sensitive photo tubes the " C " type of cathode is used (caesiumoxidised silver).
Spectral response curves for each type of cathode are given at the end of these recommendations.

## 2. OPERATING CHARACTERISTICS

For a vacuum photo tube, the anode current for a fixed quantity of light, is rea sonably constant at anode voltages above a certain low value known as the "saturation voltage".
The gas-filled photo tube contains a quantity of inert gas, the ionising potential of which is generally somewhat higher than the saturation voltage of an equivalent vacuum photo tube so that the anode current is substantially constant between the saturation voltage and the voltage at which ionisation commences. Above this voltage range, ionisation increases, resulting in a progressive increase in anode current.
Since a gas -filled photo tube operates at a higher voltage than the ionising potential it will have a greater sensitivity than a similar vacuum photo tube.
Within the operating ranges of both groups of photo tubes the anode current is directly proportional to the quantity of light incident on the cathode surface.
2.1 Luminous sensitivity. The response of a photo tube to light falling on its cathode is termed its luminous sensitivity; this is expressed in micro-amperes per lumen.
The sensitivity of all types is dependent upon the colour temperature of the light source and in some cases upon the portion of the cathode that is illuminated.

The sensitivity of gas-filled photo tubes moreover is dependent upon the anode voltage; the sensitivity of vacuum photo tubes in the "saturation region" in which region the tube mainly operates, is practically independent of the anode voltage.
Unless otherwise stated, the values given in the data sheets have been obtained by illuminating the total useful cathode area with an incandescent lamp having a colour temperature of $2700^{\circ} \mathrm{K}$.
The values given for sensitivity on the data sheets are the initial values for average photo tubes. The ratio between the maximum and minimum initial sensitivity of photo tubes of a given type will not exceed 3 to 1 .
2.2 Dark current. This is the current which flows between photocathode and anode when the photo tube is in total darkness. The tube is in total darkness when no radiation within the spectral sensitivity curve of the photocathode is present. This current is caused mainly by electrical leakage and thermionic emission from the photocathode and will therefore increase with temperature and voltage.
2.3 Frequency response. The sensitivity of a vacuum photo tube is constant for frequencies of light modulation up to those generally met in practice. Only at very high frequencies, at which transit time limitations occur, the sensitivity becomes dependent upon the frequency.
The sensitivity of gas-filled photo tubes, however, decreases with the frequency. At a frequency of 15000 Hz this decrease is about 3 dB , as is shown in the accompanying curve.

## 3. THERMAL DATA

Ambient temperature. The temperature of the photocathode may not be too high otherwise evaporation of the emissive cathode layer may result, with consequent reduction in sensitivity and life. As it is difficult to measure this temperature a limiting value for the ambient temperature is given on the published data sheets.
It must be considered, however, that even in case the ambient temperature in the immediate vicinity of the photo tube is not beyond the limit, an excessive temperature rise of the photocathode can be caused e.g. by infrared heat radiation. If the possibility of this radiation exists, a suitable filter should be inserted in the optical path to minimize this effect.

## 4. OPERATIONAL NOTES

Stability during life. Where a gas-filled photo tube is continuously operated at its maximum rated voltage its sensitivity may fall by as much as $50 \%$, during 500 hours.
Vacuum photo tubes on the other hand are inherently more stable.

The stability of both types of photo tubes will be improved if the current density of the photocathode is reduced (e.g. by reducing the incident light or enlarging the illuminated area of the photocathode).
Particularly in the case of gas-filled photo tubes reduction of the anode voltage will improve the stability.

Also in the inoperative periods photo tubes must not be exposed to strong radiation such as direct sunlight .

A loss of sensitivity of both vacuum and gas-filled photo tubes during operation will be wholly or partially restored during the inoperative periods.

Prevention of glow discharge. Gas-filled photo tubes must not be operated above the published maximum voltage since a glow discharge, indicated by a faint blue glow in the bulb, may occur which adversely affects the good operation of the photo tube and even can result in rapid destruction of the photocathode. If accidental over-running can be expected the anode resistance should have a value of at least $0.1 \mathrm{M} \Omega$.
Where it is necessary to use the maximum operating voltage a stabilized supply is recommended.

## 5. MOUNTING

If no restrictions are made on the individual published data sheets photo tubes may be mounted in any position.

## 6. STORAGE

It is necessary that photo tubes be always stored in the dark.

## 7. LIMITING VALUES

The limiting values of photo tubes are given in the absolute max. rating system.

## 8. OUTLINE DIMENSIONS

## LIFE EXPECTANCY

With an average cathode current of $50 \times 10^{-9} \mathrm{~A}$, the sensitivity will not decrease more than $10 \%$ of its initial value between zero and 500 operating hours. At lower cathode currents a higher stability may be expected.

## REMARKS

- The cathode should not be exposed to direct sunlight.
- In cases where low frequency noise influences the measuring results, this source of noise may be reduced by cooling the tube to $-90^{\circ} \mathrm{C}$.

## APPLICATION

The currents allowed through 150AV are so low that amplification will always be necessary. To maintain the precision of the signal coming from the phototube is often the main problem.

This problem may be divided into four parts:

1. Distortion due to capacitive shunting:

The signal on the input of the amplifier is

$$
v=\frac{i}{\sqrt{\frac{1}{R} 2+\omega^{2} C^{2}}}
$$

in which $\mathrm{v}=$ signal in V
$\mathrm{i}=$ current through phototube in A
$R=$ part of series-resistance (in $\Omega$ ) from which the signal is taken
$\omega=2 \pi X$ frequency of the signal in Hz
$\mathrm{C}=$ total capacitance of cathode of phototube + input-capacitance of amplifier + stray capacitance of wiring in F . The value of C will not easily be kept below 20 pF .

1) With the cathode uniformly illuminated.

If a certain distortion only is accepted the maximum frequency of the signal to be transferred will limit the value of the resistance from which the signal will be taken and by this limit the value of the signal on the input of the amplifier.
2. Noise:

The level of the signal on the input of the amplifier shall be above the noise level.
The 3 main sources of noise are:
a. Shot noise in the phototube which follows the formula:

$$
\begin{aligned}
& \mathrm{I}_{\text {noise }}=\sqrt{2 \text { ei } \times \mathrm{B}} \text { in } A_{\text {R.M.S. }} \\
& \mathrm{V}_{\text {noise }}=\text { RxI }_{\text {noise }}
\end{aligned}
$$

in which $\mathrm{e}=1.6 \times 10^{-19}$ in As
$\mathrm{i}=$ the current through the phototube in A
$B=$ the bandwidth in Hz
$\mathrm{R}=$ value of resistor from which signal is taken in $\Omega$
b. Resistance noise of that part of the series-resistor from which the input signal for the amplifier is taken.
This part of the noise follows the formula:

$$
\mathrm{V}_{\text {noise }}=\sqrt{4 \mathrm{kTRB}}
$$

in which $\mathrm{k}=1.35 \times 10^{-23}$
$\mathrm{T}=$ temperature in ${ }^{\circ} \mathrm{K}$
$\mathrm{R}=$ value of resistor in $\Omega$
$B=$ bandwidth in Hz
c. Input-noise of the amplifier

In such cases where an electron tube is used in the input of the amplifier, the noise-voltage follows the formula

$$
V_{\text {noise }}=\sqrt{\sum v^{2} e q \Delta B}
$$

The value of $V_{e q}$ as a function of frequency is different for each type of tube, but for frequencies above $1000 \mathrm{~Hz} \mathrm{~V}_{\text {eq }}$ does not change much with the frequency allowing the formula to be reduced to

$$
V_{\text {noise }}=V_{e q} \sqrt{B}
$$

In that case $V_{\text {eq }}$ can be approximated within a factor 2 to 3 by

$$
\mathrm{V}_{\mathrm{eq}}=\frac{3 \times 10^{-9} \sqrt{\mathrm{I}_{\mathrm{a}}}}{\mathrm{~S}}
$$

in which $I_{a}$ is the anode current of the tube in $A$ and $S$ is the transconductance in $\mathrm{A} / \mathrm{V}$.

## 150AV

3. Input current of the amplifier

The input-current of the amplifier should be low compared with the signal current through the phototube.
4. Linearity of the amplifier

The amplifier should have a feedback so that the stability and the distortion of the signal is not impaired.

If the circumstances are such that the signal to noise ratio cannot be kept within acceptable limits - usually there where low incident illumination levels combine with high frequencies - use of this type of phototube should be abandoned in preference to photomultipliers where the distortion due to capacitive shunting and noise sources other than shot noise are of smaller relative importance.

## Examples:

An example for a simple circuit which is useful for many purposes of static light measurements is shown in fig. 1.

In this circuit the $\mu \mathrm{A}$ meter with $50 \mu \mathrm{~A} \mathrm{f.s.d} .\mathrm{may} \mathrm{be} \mathrm{calibrated} \mathrm{in} \mathrm{milli-lumen}$ or - if the whole of the cathode is illuminated - in lux. Assuming that the pointer of the $\mu \mathrm{A}$ meter will not move with frequencies above 20 Hz , for calculation of the noise level frequencies below 20 Hz are of interest only.
For currents of $5 \times 10^{-9} \mathrm{~A}$ through the phototube the signal on the input of the amplifier is of a level of 5 V , the shot noise on a level of $10^{-4} \mathrm{~V}$, the resistance noise on a level of $10^{-5} \mathrm{~V}$, the equivalent noise voltage on the input of EC1000 on a level of $10^{-6} \mathrm{~V}$.

The feedback of this system is about 1000 times, so the accuracy is solely determined by the accuracy of the $\mu \mathrm{A}$ meter, all other sources being small.

Mains voltage variations of $+10 \%$ and $-15 \%$ are of no influence on the meas uring result.

The circuit of Fig. 1 is calibrated as follows:
Adjust $\mathrm{P}_{2}$ so that the total cathode resistance of the EC1000 is $\frac{\mathrm{A} \times \mathrm{R}_{1}}{50 \times 1000} \Omega$
in which $R_{1}$ is the value of the series resistance of the 150 AV and
A is the actual sensitivity in $\mu \mathrm{A} /$ lumen of the 150 AV as marked on the tube.
Disconnect the connection between the phototube and the grid of the EC1000 and connect the grid of EC1000 to earth. Connect the circuit to the mains and adjust $\mathrm{P}_{1}$ so that the $\mu \mathrm{A}$ meter indicates zero.

The circuit is now restored and has been calibrated for 0.02 mlumen per $\mu \mathrm{A}$ deflection of the $\mu \mathrm{A}$ meter.

For measurements of rapidly changing phenomena the series-resistor in Fig. 1 of 150 AV should be adapted for an acceptable signal to noise ratio and acceptable distortion while the $\mu \mathrm{A}$ meter should be replaced by a resistor shunted by the input of an oscilloscope.
Depending on the frequency further adaptations of the circuit may be necessary, e.g. further smoothing of the D.C. voltages and a D.C. heater supply for the EC1000.

For extremely rapid changes when all time constants of the circuit have to be reduced as far as possible a circuit as shown in fig. 2 may be used on which laser light flashes can be recorded with a rise time of the signal on the oscilloscope of 20 ns .

fig. 2

Remark $P_{1}$ and $P_{2}$ should be wirewound resistors.

$\begin{array}{llll}\text { tbulb } & \min . & -90 & { }^{\circ} \mathrm{C} \\ \text { tbulb } & \max . & +60 & { }^{\circ} \mathrm{C}\end{array}$

## LIFE EXPECTANCY

With an average cathode current of $35 \times 10^{-9} \mathrm{~A}$, the sensitivity will not decrease more than $10 \%$ of its initial value between zero and 500 operating hours. At lower cathode currents a higher stability may be expected.

## REMARKS

- The cathode should not be exposed to direct sunlight.
- In cases where low frequency noise influences the measuring results, this source of noise may be reduced by cooling the tube to $-90^{\circ} \mathrm{C}$.

## APPLICATION

Please refer to data of 150 AV .

## PHOTO TUBE

Vacuum phototube with high stability and linearity intended for use in high precision photometry (maximum intensity 1 lux) and for measurements of quickly changing light phenomena (maximum light intensity approx. 1000 lux).

## PHOTO TUBE

Top sensitive gas-filled phototube, sensitive to ultra-violet radiation, intended for use as an on-off device in flame failure circuits.

| QUICK REFERENCE DATA |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Supply voltage |  | $\mathrm{V}_{\mathrm{b}}$ |  |  |  |  |
| 220 | VRMS $^{2}$ |  |  |  |  |  |

## OPERATING PRINCIPLE

When photons of sufficient energy strike the cathode of the device electrons may be released. Provided the tube voltage is sufficiently high, these electrons may initiate a discharge. The probability that this will occur is dependent amongst other things on the value of the supply voltage and the ultra-violet radiation intensity.
The discharge will extinguish as soon as the instantaneous value of the tube voltage falls below the maintaining voltage.
It should be noted that most sources of visible light (e.g. the sun, fluorescent lamps) are at the same time sources of U.V. radiation.
Where the level of such radiation affects the reliable operation of the circuit, adequate shielding or filtering should be provided.

## DIMENSIONS AND CONNECTIONS

Dimensions in mm
Base: Noval 4 pins

The arrows show the required direction of incident radiation for highest sensitivity.
Mounting position: any

## MOUNTING

A noval socket with a centre hole diameter of at least 5.4 mm should be used. Pins 1 and 6 should be connected to pins 9 and 4 respectively on the socket.

## CHARACTERISTICS

Spectral response

Maintaining voltage
0.2 to $0.29 \mu \mathrm{~m}(2000$ to 2900 R) See also page 7
$\mathrm{V}_{\mathrm{m}} \quad 180$ to 220 V

## RECOMMENDED CIRCUITS

I. DIRECT RELAY CIRCUIT ( $t_{\mathrm{amb}}=\max \cdot 70^{\circ} \mathrm{C}$ )

Fig. 1

| $\mathrm{R}_{1}$ | $100 \Omega \pm 10 \%$ |
| :--- | :---: |
| $\mathrm{R}_{2}$ | $220 \mathrm{k} \Omega \pm 10 \%$ |
| $\mathrm{R}_{3}$ | $270 \Omega \pm 10 \%$ |
| D | 4 diodes |
| $\mathrm{C}_{1}$ | $12 \mathrm{nF} \pm 15 \%$ |
| $\mathrm{C}_{2}$ | $25 \mu \mathrm{~F} \pm 15 \%$ |

Relay:
R $\quad 12 \mathrm{k} \Omega \pm 10 \%$
$\mathrm{I}_{\mathrm{On}}<3 \mathrm{~mA}$
$I_{\text {off }} \quad 0.5$ to 1.5 mA
$\mathrm{W}_{\text {max }}>1.2 \mathrm{~W}$.

## Notes

1. The filter $\mathrm{R}_{1} \mathrm{C}_{1}$ reduces the effects of high voltage transients on the mains.
2. Incidental discharges of the tube will not activate the relay for any value of the mains voltage within the range $220 \mathrm{~V}+10 \%$ to $-15 \%$.

## Sensitivity

Under the worst probable conditions of supply voltage ( 190 V ) component vari-. ation and characteristic variation of the tube during 10.000 hours, the tube will activate the relay when a "standard radiation source" (candle, see fig.4) is at a distance $<50 \mathrm{~mm}$ from the tube.

RECOMMENDED CIRCUITS (continued)
II. INDIRECT RELAY CIRCUITS ( $\mathrm{t}_{\mathrm{amb}}=\max .100^{\circ} \mathrm{C}$ )

IIa

Fig. 2

| $\mathrm{R}_{1}$ | $100 \Omega$ |
| :--- | :--- |
| $\mathrm{R}_{2}$ | $100 \Omega$ |
| $\mathrm{R}_{3}$ | $120 \mathrm{k} \Omega \pm 10 \%$ |
| $\mathrm{R}_{4}$ | $120 \mathrm{k} \Omega \pm 10 \%$ |
| $\mathrm{R}_{5}$ | $470 \mathrm{k} \Omega \pm 10 \%$ |

| $\mathrm{C}_{1}$ | $12 \mathrm{nF} \pm 15 \%$ |
| :--- | :--- |
| $\mathrm{C}_{2}$ | $12 \mathrm{nF} \pm 15 \%$ |
| $\mathrm{C}_{3}$ | $2.2 \mu \mathrm{~F} \pm 15 \%$ |
| $\mathrm{D}_{1}, \mathrm{D}_{2}$ | diodes |

## Note

The filter $\mathrm{R}_{1} \mathrm{C}_{1}$ reduces the effects of high voltage transients on the mains.

## Sensitivity

The curve on page 8 shows the relationship between the output voltage $\mathrm{V}_{\mathrm{O}}$ and the distance between the tube and the "standard radiation source" (see fig.4) under the worst probable conditions of supply voltage ( 198 V ) and component variation for the least sensitive new tube.
After the first 10000 hours of operation the sensitivity will have decreased, but will in all cases be better than indicated by the curve on page 8 provided the radiation source is doubled (two candles according to fig.4).

## RECOMMENDED CIRCUITS (continued)

IIb

Fig. 3

| $\mathrm{R}_{1}$ | $100 \Omega \pm \pm 10 \%$ |
| :--- | :--- |
| $\mathrm{R}_{2}$ | $100 \Omega \pm \pm 10 \%$ |
| $\mathrm{R}_{3}$ | $330 \mathrm{k} \Omega \pm 10 \%$ |
| $\mathrm{R}_{4}$ | $150 \mathrm{k} \Omega \pm 10 \%$ |
| $\mathrm{R}_{5}$ | $470 \mathrm{k} \Omega \pm 10 \%$ |

$\mathrm{C}_{1} \quad 12 \mathrm{nF} \pm 15 \%$
$\mathrm{C}_{2} \quad 12 \mathrm{nF} \pm 15 \%$
$\mathrm{C}_{3} \quad 2.2 \mu \mathrm{~F} \pm 15 \%$
$\mathrm{D}_{1}$ diode

Note
The filter $\mathrm{R}_{1} \mathrm{C}_{1}$ reduces the effects of high voltage transients on the mains.

## Sensitivity

The curve on page 8 shows the relationship between the output voltage $\mathrm{V}_{0}$ and the distance between the tube and the "standard radiation source" (see fig.4) under the worst probable conditions of supply voltage ( 198 V ) and component variation for the least sensitive new tube.
After the first 10000 hours of operation the sensitivity will have decreased, but will in all cases be better than indicated by the curve on page 8 provided the radiation source is doubled (two candles according to fig.4).

## LIMITING VALUES

Ambient temperature, operating storage
$t_{a m b}$
$\max .100$
$\square$
$\min .-50{ }^{\circ} \mathrm{C}$
$\max .+50{ }^{\circ} \mathrm{C}$
${ }^{\mathrm{t}} \mathrm{stg}$
$\min .-25{ }^{\circ} \mathrm{C}$
max. $70{ }^{\circ} \mathrm{C}$ when used in cir-
cuit fig. 1 ${ }^{\circ} \mathrm{C} \begin{aligned} & \text { when used in cir- } \\ & \text { cuits fig. } 2 \text { and } 3\end{aligned}$ ${ }^{\circ} \mathrm{C} \begin{aligned} & \text { when used in cir- } \\ & \text { cuits fig. } 2 \text { and } 3\end{aligned}$

## Warning

Designers of flame failure detectors are strongly advised not to depart from the recommended circuits. Any such departure may result in an unsafe operating mode which is likely to cause an internal short in the tube before its rated useful life has expired.

## Application notes

To ensure that the intensity of radiation incident on the built-in tube will be sufficient throughout its service life ( 10000 hours in the case of a new tube) the following procedure should be observed:

## For circuit fig. 1

Place a "standard radiation source" at a distance of 50 mm from the tube and measure the average voltage across the relay.
In actual operation the same-tube should be mounted at a distance from the flame such that the average voltage across the relay is at least equal to that obtained under irradiation from the "standard radiation source" at 50 mm .
Care should be taken that the value of the mains voltage is the same during both measurements.
The flame used during this measurement should be the minimum flame which has to be detected. No further readjustment of the distance between tube and flame will be necessary when the tube has to be replaced.

## For circuits fig. 2 and fig. 3

The output power from the circuits in fig. 2 and 3 is too low for direct tripping of a relay. For effective discrimination, the voltage on the input of the added amplifier must attain a certain threshold value when the U.V. energy emitted by the flame attains a certain critical intensity.
The implication is that steps must be taken to ensure that the output voltage $V_{0}$ from the recommended circuit will remain above this threshold value throughout the life of the tube. This is done in the following way. Read from the dotted curve on page 8 the distance $d$ corresponding to the required minimum output voltage $\mathrm{V}_{0}$.
Place two "standard radiation sources" at the distance d from the tube and connect the circuit output to a d.c. voltmeter with a high input resistance; observe the average output voltage $\mathrm{V}_{0}$. (The mean value around which the needle swings.)
In actual operation the same tube should be mounted at a distance from the flame such that the average output voltage $\mathrm{V}_{\mathrm{O}}$ is at least equal to that obtained under irradiation from the two "standard irradiation sources" at the distance d.

Care should be taken that the value of the mains voltage is the same during both measurements.
The flame used during this measurement should be the minimum flame which has to be detected.
No further readjustment of the distance between tube and flame is necessary when the tube has to be replaced.

Above procedures do of course not include allowance for dirt deposited on the tube during life.

Fig. 4
"Standard radiation source"

The output voltage as a function of the distance between radiation source and the least sensitive tube in the circuit of fig. 3 .
The curve is valid at 0 hours when the tube is irradiated by one "standard radiation source" and at 10000 hours when irradiated by two "standard radiation sources".

The output voltage as a function of the distance between radiation source and the least sensitive tube in the circuit of fig. 2 .
The curve is valid at 0 hours when the tube is irradiated by one "standard radiation source" and at 10000 hours when irradiated by two "standard radiation sources".

## ASSOCIATED ACCESSORIES

## FOCUSING COIL

When the Q13-110. . is operated at $\mathrm{Vg}_{2}(\ell)=25 \mathrm{kV}$, the current through the focusing coil should be adjusted at approx. 33 mA .

The distance between air-gap centre and the screen surface of the Q13-110.. should be 217 mm .

[^18]:    1) In order to avoid excessive hum, the A.C. component of the heater to cathode voltage should be as low as possible and should not exceed 20 VRMS.
    ${ }^{2}$ ) During a heating-up period not exceeding 45 sec .
[^19]:    ${ }^{1}$ ) Spots (black and white) and smudges (black and white) are not counted when their contrast expressed in \% of picture white as measured on a waveform oscilloscope is less than $50 \%$.
    2) Spots of this size are allowed unless concentration causes a smudge appearance. As contrast of the smudge the average contrast of the concentration is taken.

[^20]:    ${ }^{1}$ ) Video amplifiers should be capable of handling signal-electrode currents of this magnitude without overloading the amplifier or distorting the picture.
    ${ }^{2}$ ) Under difficult environmental conditions a flow of cooling air directed at the faceplate is recommended. When televising flames and furnacesappropriateinfra-red filters should be used.

[^21]:    *Registered Trade Mark for T. V. camera tube 1) 2) ${ }^{3}$ ) ${ }^{4}$ ) See page 5 .

[^22]:    *Registered Trade Mark for T.V. camera tube
    $\left.\left.{ }^{1}\right)^{2}\right)^{3}$ ) See page 5.

[^23]:    *Registered Trade Mark for T.V. camera tube

[^24]:    * Registered Trade Mark for television camera tube.

[^25]:    Notes: see page 5.

[^26]:    * Registered Trade Mark for T.V. camera tube $\left.\left.\left.{ }^{1}\right)^{2}\right)^{3}\right)^{4}$ ) See page 5.

[^27]:    * Registered Trade Mark for T.V. camera tube.

[^28]:    ${ }^{1}$ ) Cap. $a_{S}$-rest, which effectively is the output impedance, increases when the tube is inserted into the deflection/focusing coil assembly.

[^29]:    ${ }^{1}$ ) The relation between the incident luminous flux and the tube current is linear within measuring errors, provided the anode voltage is higher than the saturation voltage.

[^30]:    ${ }^{1}$ ) The relation between the incident luminous flux and the tube current is linear within measuring errors, provided the anode voltage is higher than the saturation voltage.

[^31]:    1) The relation between the incident luminous flux and the tube current is linear within measuring errors, provided the anode voltage is higher than the saturation voltage.
